CHAPTER

MAINTENANCE AND INSPECTIONS

Modern AC drives are based on solid state electronics technology, including ICs, resistors, capacitors, transistors, cooling fans, relays, etc. These components have a limited life under normal operation. Preventive maintenance is required to operate the GS30 drive in its optimal condition, and to ensure a long life. We recommend that a qualified technician perform a regular inspection of the GS30 drive. Some items should be checked once a month, and some items should be checked yearly.

NOTE: All inspections should be accomplished with Safety in mind with due and required caution. Some of these Inspection items may require the Drive to be powered down, while others may require power to be applied. Proper safety precautions including the use of PPE is required. Please review cautionary statements in each section.

MONTHLY INSPECTION

Check the following items at least once a month.

- 1) Make sure the motors are operating as expected.
- 2) Make sure the drive installation environment is normal.
- 3) Make sure the enclosure and drive cooling systems are operating as expected.
- 4) Check for irregular vibrations or sounds during operation.
- 5) Make sure the motors are not overheating during operation.
- 6) Check the input voltage to the GS30 drive and make sure the voltage is within the operating range.

ANNUAL INSPECTION

Check the following items once annually.

- 1) Check the torque of the GS30 power and control terminal screws and tighten if necessary. They may loosen due to vibration or changing temperatures.
- 2) Make sure the conductors and insulators are not corroded or damaged.
- 3) Check the resistance of cable insulation with a megohmmeter.
- 4) Clean off any dust and dirt with a vacuum cleaner. Pay special attention to cleaning the ventilation ports and PCBs. Always keep these areas clean. Accumulation of dust and dirt in these areas can cause unforeseen failures.
- 5) Recharge the capacitors of any drive that is in storage or is otherwise unused.

RECHARGE CAPACITORS (FOR DRIVES NOT IN SERVICE)

Recharge the DC link before using any drive that has not been operated within a year:

- 1) Disconnect the motor from the drive.
- 2) Apply input power to the drive for 2 hours.

If the drive is stored or is otherwise unused for more than a year, the drive's internal DC link capacitors should be recharged before use. Otherwise, the capacitors may be damaged when the drive starts to operate. We recommend recharging the capacitors of any unused drive at least once per year.

DISCONNECT AC POWER AND ENSURE THAT THE INTERNAL CAPACITORS HAVE FULLY DISCHARGED BEFORE INSPECTING THE GS30 DRIVE! WAIT AT LEAST FIVE MINUTES AFTER ALL DISPLAY LAMPS HAVE TURNED OFF.

- ☑ Wait 5 seconds after a fault has been cleared before performing reset via keypad or input terminal.
- ✓ When the power is off after 5 minutes for ≤ 30hp models and 10 minutes for ≥ 40hp models, please confirm that the capacitors have fully discharged by measuring the voltage between + and -. The voltage between + and should be less than 25VDC.

- Only qualified personnel can install, wire and maintain drives.
 Please take off any metal objects, such as watches and rings, before operation. And only insulated tools are allowed.
- ☑ Never reassemble internal components or wiring.
- ☑ Make sure that installation environment complies with regulations without abnormal noise, vibration and smell.

Recommended Inspection Schedules

Before the check-up, always turn off the AC input power and remove the cover. Wait at least 10 minutes after all display lamps have gone out, and then confirm that the capacitors have fully discharged by measuring the voltage between DC+ and DC-. The voltage between DC+ and DC-should be less than 25VDC.

Ambient environment

			Maintenance Period			
Check Items	Methods and Criteria	Daily	Half Year	One Year		
Check the ambient temperature, humidity, vibration and see if there are any dust, gas, oil or water drops	Visual inspection and measurement with equipment with standard specification	0				
If there are any dangerous objects	Visual inspection	0				

Voltage

		Maintenance Period		
Check Items	Methods and Criteria	Daily	Half Year	One Year
Check if the voltage of main circuit and control circuit is correct	Measure with multimeter with standard specification	0		

Digital Keypad Display

		Maintenance Period			
Check Items	Methods and Criteria	Daily	Half Year	One Year	
Is the display clear for reading	Visual inspection	\bigcirc			
Any missing characters	Visual inspection	\bigcirc			

Mechanical parts

		Maintenance Perio		
Check Items	Methods and Criteria	Daily	Half Year	One Year
If there is any abnormal sound or vibration	Visual and audible inspection		\bigcirc	
If there are any loose screws	Tighten the screws		\bigcirc	
If any part is deformed or damaged	Visual inspection		\bigcirc	
If there is any color change due to overheating	Visual inspection		0	
If there is any dust or dirt	Visual inspection		\bigcirc	

Recommended Inspection Schedules (continued)

Main circuit

		Mainte	Period	
Check Items	Methods and Criteria	Daily	Half Year	One Year
If there are any loose or missing screws	Tighten or replace the screw	\bigcirc		
If any drive or wiring insulation is deformed, cracked, damaged or has changed color due to overheating or aging	Visual inspection NOTE: Ignore any color change of copper plate		\bigcirc	
If there is any dust or dirt	Visual inspection		\bigcirc	

Terminals and wiring of main circuit

Check Items	Methods and Criteria	Maintenance Period			
		Daily	Half Year	One Year	
If the terminal color or the placement has changed due to overheating	Visual inspection		\bigcirc		
If the wiring insulation is damaged or there has been a color change	Visual inspection		0		
If there is any damage	Visual inspection	\bigcirc			

DC capacity of main circuit

		Maintenance Period			
Check Items	Methods and Criteria	Daily	Half Year	One Year	
If there is any liquid leaking, color change, crack or deformation	Visual inspection	0			
If the capacitor safety vent is bulging or inflated.	Visual inspection	0			
Measure static capacity when required (if drive overloads/faults during normal operation)	Measure with multimeter with standard specification	0			

Recommended Inspection Schedules (continued)

Resistor of main circuit

Check Items	Methods and Criteria	Maintenance Perio			
		Daily	Half Year	One Year	
If there is any peculiar smell or insulation cracks due to overheating	Visual inspection, smell	0			
If there is any disconnection or discoloration	Visual inspection	0			
If the connection is damaged	Measure with a multimeter with standard specifications	0			

Transformer and reactor of main circuit

		Maintenance Period		
Check Items	Methods and Criteria	Daily	Half Year	One Year
If there is any abnormal vibration or peculiar smell	Visual, audible inspection and smell	0		

Magnetic contactor and relay of main circuit

		Maintenance Period		
Check Items	Methods and Criteria	Daily	Half Year	One Year
If there are any loose screws	Visual and audible inspection	\bigcirc		
If the contact works correctly	Visual inspection	\bigcirc		

Printed circuit board and connector of main circuit

		Mainte	enance	Period
Check Items	Methods and Criteria	Daily	Half Year	One Year
If there are any loose screws and connectors	Tighten the screws and press the connectors firmly in place		\bigcirc	
If there is any peculiar smell and/or color change	Visual and smell inspection		\bigcirc	
If there is any crack, damage, deformation or corrosion	Visual inspection		\bigcirc	
If there is any liquid leakage or deformation in capacity	Visual inspection		\bigcirc	

Recommended Inspection Schedules (continued)

Cooling fan of cooling system

		Mainte	enance	Period
Check Items	Methods and Criteria		Half Year	One Year
If there is any abnormal sound or vibration	Visual, audible inspection and turn the fan with hand (turn off the power before operation) to see if it rotates smoothly		\bigcirc	
If there is any loose screw	Tighten the screw		\bigcirc	
If there is any color change due to overheating	Change the fan		\bigcirc	

Ventilation channel of cooling system

		Mainte	Period	
Check Items	Methods and Criteria	Daily	Half Year	One Year
If there is any obstruction in the heat sink, air intake or air outlet	Visual inspection		\bigcirc	

Please use a clean lint free cloth for cleaning and use a dust cleaner to remove dust when necessary.

TROUBLESHOOTING

WARNING CODES

The GS30 drive has a comprehensive diagnostic system that includes several different warning codes. The most common warning codes can be read on the digital keypad display.

For communication errors, "Upper unit" is referring to the Master controller of the serial network. Always ensure the communication settings of the drive (P09.01 and P09.04) match those of the master controller and network.

FAULT CODES

The GS30 drive has a comprehensive fault diagnostic system that include a variety of fault messages. When a fault is detected, the GS30 drive will shut down in order to protect internal components. The following faults are displayed as shown on the GS30 digital keypad display. For communication errors, "Upper unit" is referring to the Master controller of the serial network. Always ensure the communication settings of the drive (P09.01 and P09.04) match those of the master controller and network.

Gaps in the fault ID numbers below are set aside as "reserved" faults for possible future use. Should your GS30 drive <u>repeatedly</u> display a reserved fault, please note the fault ID number and contact AutomationDirect technical support.

Fault Codes				
Display on GS30 Keypad	ID No.	Fault Name and Description	Action, Reset, a	and Corrective Action
	1	Over-current during acceleration (ocA) Output current exceeds three times of the rated current during acceleration. When ocA occurs, the drive closes the gate of the output immediately, the motor runs freely, and the display shows an ocA error.	Action Level Action Time Fault setting parameter Reset method Reset condition Record	 300% of the rated current Immediately act N/A Manual reset Reset in five seconds after the fault is cleared Yes 1) Check acceleration time. If too short: a) Increase the acceleration time of S-curve c) Set auto-acceleration and auto-deceleration parameter (P01.44) d) Set over-current stall prevention function (P06.03) e) Replace the drive with a larger capacity model. 2) Check the motor cable and remove causes of any short circuits, or replace the cable before turning on the power. 3) Check the motor insulation value with megger. Replace the motor if the insulation is poor. 4) Check if the output current during the whole working process exceeds the AC motor drive's rated current. If yes, replace the AC motor drive's nameplate should ≤ the rated current on the motor's nameplate should ≤ the rated current of the drive). 7) Check the action timing of the contactor and make sure it is not turned ON/OFF when the drive outputs the voltage. 8) Adjust the V/F curve setting and frequency/voltage. When the fault occurs, and the frequency voltage is too high, reduce the voltage. 9) Adjust the torque compensation (refer to P07.26 torque compensation gain) until the output current reduces and the motor does not stall. 10) Verify the wiring of the control circuit and the wiring/grounding of the main circuit to prevent interference. 11) Enable speed tracking during start-up of P07.12.
				 12) Correct the parameter settings for speed tracking. a) Start the speed tracking function. b) Adjust the maximum current for P07.09 speed tracking. 13) Check the settings for P00.11 control mode: a) For IM, P00.11=0, 1, 2, 5 b) For PM, P00.11=2 14) Increase the AC motor drive's capacity.
			(contin	15) Install AC reactor(s) on the output side (U/V/W)

	Over-current during deceleration (ocd) Output current exceeds three times of the rated current during deceleration. When ocd occurs, the drive closes the gate of the output immediately, the motor runs freely, and the display shows an ocd error.	Actions	 Check if the deceleration time is too short. If so: a) Increase the deceleration time of S-curve c) Set auto-acceleration and auto-deceleration parameter (P01.44) d) Set over-current stall prevention function (P06.03) e) Replace the drive with a larger capacity model Check if the mechanical brake of the motor activates too early. Check the motor cable and remove causes of any short circuits, or replace the cable before turning on the power. Check the motor insulation value with megger. Replace the motor if the insulation is poor. Check if the output current during the whole working process exceeds the AC motor drive's rated current. If yes, replace the AC motor drive with a larger capacity model. Check the impulsive change of the load and reduce the load or increase the capacity of AC motor drive as needed. Verify the motor capacity, the rated current on the motor's nameplate should ≤ the rated current of the drive. If using an ON/OFF controller at the (U//W) drive output, check the action timing of the contactor and make sure it is not turned ON/OFF when the drive outputs the voltage. Adjust the V/F curve settings and frequency/voltage. When the fault occurs, and the frequency voltage is too high, reduce the voltage. Adjust the P07.26 torque compensation gain until the output current reduces and the motor does not stall. Verify the wiring of the control circuit and the wiring/grounding of the main circuit to prevent interference. Check the length of the motor cable. If it is too long, increase the AC motor drive's capacity or install AC reactor(s) on the output side (U/V/W). In the case of a hardware error, the ocd occurs due to the short circuit or ground fault at the output side of the drive. a) Check for possible

ID No.	Fault Name and Description	Action, Reset, o	and Corrective Action
			300% of the rated current Immediately act N/A Manual reset Reset in five seconds after the fault is cleared Yes
3	Over-current during steady operation (ocn) Output current exceeds three times of the rated current during constant speed. When ocn occurs, the drive closes the gate of the output immediately, the motor runs freely, and the display shows an ocn error.	Corrective Actions	 Check the motor cable and remove causes of any short circuits, or replace the cable before turning on the power. Check for possible shaft lock, burnout or aging insulation of the motor. a) Check the motor insulation value with megger. Replace the motor if the insulation is poor. Check for impulsive change of the load, and reduce the load or increase the capacity of AC motor drive. Check motor capacity (the rated current on the motor's nameplate should ≤ the rated current of the drive) If using an ON/OFF controller at the drive output, check the action timing of the contactor and make sure it is not turned ON/OFF when the drive outputs the voltage. Adjust the V/F curve settings and frequency/voltage. When the fault occurs, and the frequency voltage is too high, reduce the voltage. Adjust P07.26 torque compensation gain until the output current reduces and the motor does not stall. Verify the wiring of the control circuit and the wiring/grounding of the main circuit to prevent interference. Check the length of the motor cable. If too long: a) Increase the AC motor drive's capacity. b) Install AC reactor(s) on the output side of the drive. a) Check for possible short circuit between terminals with the electric meter: b) B1 corresponds to U, V and W; DC- corresponds to U, V, and W; corresponds to U, V, and W. c) If short circuits occurs, contact AutomationDirect Technical Support.
		Action Time Fault setting	N/A N/A N/A
4	Ground fault (GFF) When the drive detects grounding short circuit on the output terminals (U/V/W), the drive closes the gate of the output immediately, the motor runs freely, and the display shows a GFF error.	Reset method Reset condition Record Corrective Actions	 Manual reset Reset in five seconds after the fault is cleared Yes 1) Check for motor burnout or aging insulation. a) Check the motor insulation value with megger. b) Replace the motor if the insulation is poor. 2) Check the cable for short circuits and replace the cable if needed. 3) If the motor cable length exceeds 100 m, decrease the setting value for the carrier frequency and take remedies to reduce stray capacitance. 4) Verify the grounding and wiring of the communication circuit. Separate the communication circuit from the main circuit, or wire in 90 degree for effective anti-interference performance. 5) Cycle the power after checking the status of motor, cable, and cable length. If GFF still exists, contact AutomationDirect Technical Support. 6) Refer to the corrective actions for ocd.
	3	ID No. Description Over-current during steady operation (ocn) Output current exceeds three times of the rated current during constant speed. 		Capacitor hardware fault (tH2o) Hardware failure in capacitor temperature detection	Action Level	still exists. If yes, contact AutomationDirect Technical Support. NTC broken or wiring failure
£H2o	19 Hardware capacitor		Action Time	When the IGBT temperature is higher than the protection level, and detection time exceeds 100 ms, the tH2o protection activates.
			Fault setting parameter	N/A
			Reset method Reset condition	Manual reset Immediately reset
			Record	Yes
			Corrective	Wait for 10 minutes, and then cycle the power. Check if tH2o protection
			Actions	still exists. If yes, contact AutomationDirect Technical Support.

Fault Codes (continued)					
Display on GS30 Keypad	ID No.	Fault Name and Description	Action, Reset, o	and Corrective Action	
		Over load (oL)	Action Level	Based on overload curve and derating curve.	
		The AC motor drive detects excessive drive output current.	Action Time	When the load is higher than the protection level and exceeds allowable time, the oL protection activates.	
			Fault setting parameter	N/A	
		Overload capacity:	Reset method	Manual reset	
		Variable Torque (VT):	Reset condition Record	Reset in five seconds after the fault is cleared Yes	
οL	21	 Sustains for one minute when the drive outputs 120% of the drive's rated output current. Sustains for three seconds when the drive outputs 150% of the drive's rated output current. Constant Torque (CT): Sustains for one minute when the drive outputs 150% of the drive's rated output current. Sustains for three seconds when the drive outputs 200% of the drive's rated output current. 	Corrective Actions	 Reduce the load. Increase the setting value for P01.12–P01.19 (accel./decel. time) Adjust the settings for P01.01–P01.08 (V/F curve), especially the setting value for the mid-point voltage (if the mid-point voltage is set too low, the load capacity decreases at low speed). Refer to the V/F curve selection of P01.43. Replace the drive with a larger capacity model. If the oL only occurs during low-speed operations: a) Reduce the load during low-speed operation. b) Increase the carrier frequency of P00.17. Adjust P07.26 Torque Compensation Gain until the output current reduces and the motor does not stall. Verify stall prevention is set to the proper value. Check the status of three-phase motor and verify the cable is not broken or screws are loose. Verify the parameter settings for speed tracking. a) Start the speed tracking function. b) Adjust the maximum current for P07.09 speed tracking. 	
		Electronics thermal relay 1 protection (EoL1) Electronics thermal relay 1 protection. The drive coasts to stop once it activates.	Action Level Action Time Fault setting parameter Reset method	Start counting when the output current > 150% of the motor 1 rated current P06.14 (If the output current is larger than 105% of the motor 1 rated current again within 60 sec., the counting time reduces and is less than P06.14) N/A Manual reset	
			Reset condition	Reset in five seconds after the fault is cleared	
			Record	Yes	
EoL I	22		Corrective Actions	 Reduce the load. Reduce the load. Increase the setting value for P01.12–P01.19 (accel./decel. time) Adjust the settings for P01.01–P01.08 (V/F curve), especially the setting value for the mid-point voltage (if the mid-point voltage is set too low, the load capacity decreases at low speed). Refer to the V/F curve selection of P01.43. If the EoL1 only occurs during low-speed operations: a) Replaced the drive with a dedicated VFD model. b) Increase the motor capacity. If using a VFD dedicated motor, verify P06.13=1: Standard motor (motor with fan on the shaft). Verify motor rated frequency and reset if needed. Verify motor rated frequency and reset if needed. If using one drive to run multiple motors, set P06.13=2: Disable, and install thermal relay on each motor. Set stall prevention to the proper value. Adjust P07.26 torque compensation gain until the current reduces and the motor does not stall. Check the status of the fan, or replace the fan. Replace the motor.

Fault Codes (continued)				
	Fault Name and Description	Action, Reset, a	and Corrective Action	
		Action Level Action Time Fault setting parameter	Hardware detection Immediately act N/A	
		Reset method	Manual reset Immediately reset Yes	
	Auto-tuning error (AUE) Motor auto-tuning error	Corrective Actions	 This error can occur if you press the STOP key during auto-tuning. Re-execute auto-tuning. Check motor capacity and related parameters. a) Set the correct parameters P01.01–P01.02. b) Set P01.00 larger than the motor rated frequency. Check the motor wiring. Check for motor shaft lock and remove cause of lock if needed. Check for electromagnetic contactor at output (U/V/W) and make sure the electromagnetic valve is OFF. Verify load. If too heavy: a) Reduce the load. b) Replace the motor with a larger capacity model. Check if accel/decel time is too short, then increase the setting values for P01.12–P01.19 (accel./decel. time) if needed. 	
		Action Level Action Time Fault setting parameter	When the analog input < 4 mA (only detects 4–20 mA analog input) P08.08 P08.09 setting is: 0: Warn and continue operation 1: Fault and ramp to stop 2: Fault and coast to stop	
	PID loss AI2 (AFE) PID feedback loss (analog feedback signal is only valid when the PID function is enabled)	Reset method Reset condition	3: Warn and operate at last frequency When P08.09=3 or 4, AFE is a "Warning". When the feedback signal is > 4 mA, the "Warning" is automatically cleared. When P08.09=1 or 2, AFE is a "Fault". You must reset manually. Immediately reset	
		Record Corrective Actions	 When P08.09=1 or 2, AFE is a "Fault", and the fault is recorded; when P08.09=3 or 4, AFE is a "Warning", and the warning is not recorded. 1) Check the PID feedback cable and tighten the terminal. Replace the cable with a new one if needed. 2) Check for feedback device failure and replace the device with a new one. 3) Check all the wiring. If AFE fault still exists, contact AutomationDirect Technical Support. 	
		Action Level	Software detection	
	PG feedback error (PGF1)	Action Time Fault setting parameter	P10.09 P10.08 0: Warn and keep operation 1: Fault and ramp to stop 2: Fault and coast to stop	
rr t r	The motor runs in a	Reset method Reset condition Record Corrective Actions	Manual reset Immediately resets Yes 1) Check and reset encoder parameter (P10.02) if incorrect. 2) Check encoder wiring and rewire if necessary. 3) Check the PG card or encoder, replace if failed. 4) Verify wiring of the control circuit and wiring/grounding of the main circuit to prevent interference.	
P9F2 43 [PG feedback loss (PGF2) P10.00 and P10.02 is not set in the PG control mode. When	Action Level Action Time Fault setting parameter Reset method Reset condition	Software detection Immediately act N/A Manual reset Immediately reset	
4	press "RUN" key, PGF2	Record Corrective Actions (contin	Yes 1) Reset encoder parameters (P10.00 and P10.02) 2) Verify correct control mode is selected (P00.11=1). nued next page)

Display on GS30 Keypad	ID No.	Fault Name and Description	Action, Reset, o	and Corrective Action
		PG feedback stall (PGF3)	Action Level Action Time	P10.10 P10.11 P10.12 setting is:
		Under PG mode, when the motor frequency exceeds the encoder	Fault setting parameter	0: Warn and continue operation 1: Fault and ramp to stop 2: Fault and coast to stop
P9F3	44	observer stall level	Reset method	Manual reset
		(P10.10) and starts	Reset condition Record	Immediately reset
		to count, the fault time is longer than the detection time of encoder observer stall (P10.11), then PGF3 fault occurs.	Corrective Actions	 Yes Reset encoder parameter (P10.01) Value for P01.00 may be too low, set a higher value. Reset ASR parameters. Verify accel/decel times and reset if needed. Reset PG feedback stall values, P10.10 and P10.11.
			Action Level	P10.13
		PG slip error (PGF4)	Action Time Fault setting parameter	P10.14 P10.15 setting is: 0: Warn and continue operation 1: Fault and ramp to stop 2: Fault and coast to stop
РЭFЧ	45	Under PG mode, when the motor frequency exceeds encoder observer slip range (P10.13) and starts to count, the fault	Reset method	 Auto: When P10.15=0, PGF4 is a "Warning". When the deviation between the output frequency and motor frequency is smaller than the encoder observer slip range, the warning is automatically cleared. Manual: When P10.15=1 or 2, PGF4 is a "Fault" and you must reset manaully.
			Reset condition	Immediately reset
		time is longer than	Record	When P10.15=1 or 2, PGF4 is a "Fault" and the fault is recorded.
		time is longer than the detection time of encoder observer slip (P10.14), PGF4 fault occurs.	Corrective Actions	 Reset PG feedback parameters (P10.13 and P10.14) Reset ASR parameters. Verify accel/decel times and reset if needed. Reset encoder parameters (P0.01). Verify torque limit and set new values if needed (P06.12, P11.17-P11.20) Check for and resolve any causes of motor shaft lock. Check the mechanical brake has released correctly and verify the timing of the system.
			Action Level	When the analog input is < 4 mA (only detects 4–20 mA analog input)
		AI2 loss (ACE)	Action Time Fault setting parameter	Immediately act P03.19 setting is: 0: Disable 1: Continue operation at the last frequency (warning, ANL is displayed on the keypad) 2: Decelerate to stop (warning, ANL is displayed on the keypad) 3: Stop immediately and display ACE When P03.19=1 or 2, ACE is a "Warning". When analog input signal is > 4
ACE	48	Analog input loss (including all the 4–20 mA analog signal)	Reset method Reset condition	mA, the warning is automatically cleared. When P03.19=3, ACE is a "Fault". You must reset manually. Immediately reset
			Record	When P03.19=3, ACE is a "Fault", and the fault is recorded.
			Corrective Actions	 Check the Al2 feedback cable and tighten the terminal. Replace the cable with a new one if needed. Check for external device failure and replace the device with a new one. Check all the wiring. If ACE fault still exists, contact AutomationDirect Technical Support.

Check the cable condition and replace the cable if necessary. 3) Ensure a single-phase motor is not being used with a three-phase drive 4) Check the flat cable of the control board. Re-do the wiring and test again if the flat cable is loose. If the fault still exists, contact AutomationDirect Technical Support. 5) Verify that the three-phase current is balanced with a current clamp meter. If it is balanced and the oPL3 fault still exists, contact AutomationDirect Technical Support. 6) Make sure the capacity of the drive and motor match each other.
		Low frequency overload protection (oL3) Low frequency and high current protection	Action Level Action Time Fault setting parameter	Software detection Immediately act N/A
οLЭ	87		Reset condition Record Corrective Actions	 Manual reset Immediately reset Yes 1) Enhance the heat dissipation capacity for the cabinet. 2) Lower the carrier frequency (P00.17). 3) Decrease the voltage settings that correspond to frequency below 15 Hz in the V/F curve. 4) Set P00.11=0 (V/F, general control mode). 5) Replace the drive with a higher power model.

Fault Codes (continued)				
Display on GS30 Keypad	ID No.	Fault Name and Description	Action, Reset, o	and Corrective Action
			Action Level	P14.75
		Over-torque 3 (ot3)	Action Time Fault setting parameter	P14.76 P14.74 setting is: 0: No function 1: Continue operation after over-torque detection during constant speed operation 2: Stop after over-torque detection during constant speed operation 3: Continue operation after over-torque detection during RUN
			Reset method	4: Stop after over-torque detection during RUN When P14.74=1 or 3, ot3 is a "Warning". The warning is automatically cleared when the output current < P14.75. When P14.74=2 or 4, ot3 is a "Fault". You must reset manually.
		When the output	Reset condition	Immediately reset
oŁЭ	128	current exceeds the over-torque detection level (P14.75) and exceeds over-torque detection time (P14.76), and when P14.74 is set to 2 or 4, the ot3 error displays.	Record Corrective Actions	 P14.74=2 or 4, ot3 is a "Fault", and the fault is recorded. 1) Configure the settings for P14.75 and P14.76 again. 2) Check for mechanical error and remove the causes of malfunction. 3) Verify load and decrease the loading or replace with a motor with larger capacity if load is too high. 4) Verify accel/decel time and increase the setting values for P01.12– P01.19 (accel./ decel. time) if work cycle is too short. 5) Verify V/F voltage and adjust the V/F curve (Motor 3, P01.54–P01.61), especially the setting value for the mid-point voltage (if the mid-point voltage is set too small, the load capacity decreases at low-speed). 6) Replace motor with a larger capacity motor. 7) Check for overload during low-speed operation and decrease the loading during low-speed operation or increase the motor capacity. 8) Verify torque compensation and adjust P07.73 torque compensation gain until the output current decreases and the motor does not stall. 9) Correct the parameter settings for speed tracking. Start the speed
			Action Level Action Time	tracking function. Adjust the maximum current for P07.09 speed tracking. P14.78 P14.79
	129	Over-torque 4 (ot4) When the output current exceeds the over-torque detection level (P14.78) and exceeds over-torque detection time (P14.79), and when P14.77 is set to 2 or 4, the ot4 error displays.	Fault setting parameter	 P14.77 setting is: 0: No function 1: Continue operation after over-torque detection during constant speed operation 2: Stop after over-torque detection during constant speed operation 3: Continue operation after over-torque detection during RUN 4: Stop after over-torque detection during RUN
			Reset method Reset condition	When P14.77=1 or 3, ot3 is a "Warning". The warning is automatically cleared when the output current < P14.75. When P14.77=2 or 4, ot3 is a "Fault". You must reset manually. Immediately reset
o£4			Record Corrective Actions	 P14.77=2 or 4, ot3 is a "Fault", and the fault is recorded. 1) Configure the settings for P14.78 and P14.79 again. 2) Check for mechanical error and remove the causes of malfunction. 3) Verify load and decrease the loading or replace with a motor with larger capacity if load is too high. 4) Verify accel/decel time and increase the setting values for P01.12–P01.19 (accel./ decel. time) if work cycle is too short. 5) Verify V/F voltage and adjust the V/F curve (Motor 3, P01.63–P01.70), especially the setting value for the mid-point voltage (if the mid-point voltage is set too small, the load capacity decreases at low-speed). 6) Replace motor with a larger capacity motor. 7) Check for overload during low-speed operation or increase the motor capacity. 8) Verify torque compensation and adjust P07.75 torque compensation gain until the output current decreases and the motor does not stall. 9) Correct the parameter settings for speed tracking. Start the speed tracking function. Adjust the maximum current for P07.09 speed tracking.

Fault Codes (continued)				
Display on GS30 Keypad	ID No.	Fault Name and Description	Action, Reset, o	and Corrective Action
			Action Level Action Time	Start counting when output current > 150% of the motor 3 rated current. P14.81 (If the output current is larger than 105% of the motor 3 rated current again within 60 sec., the counting time reduces and is less than P14.81)
			Fault setting parameter	N/A
			Reset method Reset condition	Manual reset Reset in five seconds after the fault is cleared
			Record	Yes
EoL3	134	Internal communication error (EoL3) Electronic thermal relay 3 protection. The drive coasts to stop once it activates.	Corrective Actions	 Reduce the load. Increase the setting value for P01.12–P01.19 (accel./decel. time) Adjust the settings for P01.54–P01.61 (V/F curve), especially the setting value for the mid-point voltage (if the mid-point voltage is set too low, the load capacity decreases at low speed). Refer to the V/F curve selection of P01.43. If the EoL3 only occurs during low-speed operations: a) Replaced the drive with a dedicated VFD model. b) Increase the motor capacity. If using a VFD dedicated motor, verify P14.80=1: Standard motor (motor with fan on the shaft). Verify motor rated current and reset if needed. Verify motor rated frequency and reset if needed. If using one drive to run multiple motors, set P14.80=2: Disable, and install thermal relay on each motor. Set stall prevention to the proper value. Adjust P07.73 torque compensation gain until the current reduces and the motor does not stall. Check the status of the fan, or replace the fan. Replace the motor.
EoL4	135	Internal communication error (EoL4) Electronic thermal relay 4 protection. The drive coasts to stop once it activates.	Action Level Action Time Fault setting parameter Reset method Reset condition Record Corrective Actions	 Start counting when the output current > 150% of the motor 4 rated current. P14.83 (If the output current is larger than 105% of motor 4 rated current again within 60 sec., the counting time reduces and is less than P14.83) N/A Manual reset Reset in five seconds after the fault is cleared Yes 1) Reduce the load. 2) Increase the setting value for P01.12–P01.19 (accel./decel. time) 3) Adjust the settings for P01.62–P01.70 (V/F curve), especially the setting value for the mid-point voltage (if the mid-point voltage is set too low, the load capacity decreases at low speed). Refer to the V/F curve selection of P01.43. 4) If the EoL4 only occurs during low-speed operations: a) Replaced the drive with a dedicated VFD model. b) Increase the motor capacity. 5) If using a VFD dedicated motor, verify P14.82=1: Standard motor (motor with fan on the shaft). 6) Verify motor rated current and reset if needed. 7) Verify motor rated frequency and reset if needed. 8) If using one drive to run multiple motors, set P14.82=2: Disable, and install thermal relay on each motor. 9) Set stall prevention to the proper value. 10) Adjust P07.75 torque compensation gain until the current reduces and the motor does not stall. 11) Check the status of the fan, or replace the fan. 12) Replace the motor.

TYPICAL AC DRIVE PROBLEMS AND SOLUTIONS

GREASE AND DIRT PROBLEMS

In those industries where grease and dirt are common. Please be aware of the possible damage that grease, oil, and dirt, may cause to your GS30 drive:

- 1) Electronic components that silt up with greasy oil may cause the drive to burn out or even explode.
- 2) Most greasy dirt contains corrosive substances that may damage the drive.

Solution:

Install the GS30 drive in a suitable enclosure to protect it from grease and dirt. Clean and remove grease and dirt regularly to prevent damage of the drive.

FIBER DUST PROBLEM

Problems related to fiber dust are typical in the textile industry. Please be aware of the possible damage that fiber dust may cause to your GS30 drive:

- 1) Fiber dust that accumulates or adheres to the fans will result in poor ventilation and cause overheating problems.
- 2) Textile plant environments with high humidity levels may experience GS30 drive failure or damage as a result of wet fiber dust adhering to components within the drive.

Solution:

Install the GS30 drive in a suitable enclosure to protect it from fiber dust. Clean and remove fiber dust regularly to prevent damage to the drive.

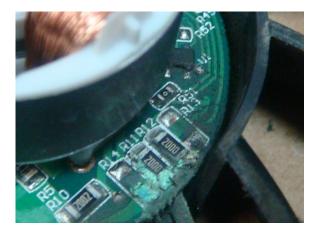

CORROSION PROBLEM

Corrosion problems may occur if any fluids or liquid in vapor form flows into the GS30 drive. Please be aware of the damage that corrosion may cause to your drive.

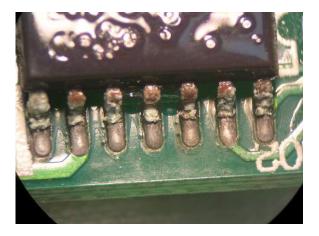

• Corrosion of internal components may cause the GS30 drive to malfunction and possibly explode.

Solution:

Install the GS30 drive in a suitable enclosure to protect it from fluids. Clean the drive regularly to prevent corrosion.

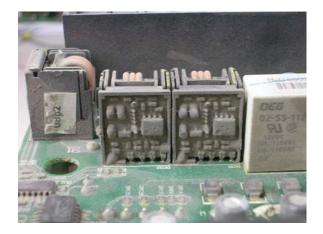

INDUSTRIAL DUST PROBLEM

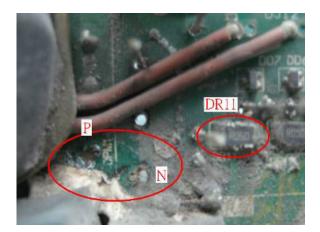

Serious industrial dust pollution frequently occurs in stone processing plants, flour mills, cement plants, and so on. Please be particularly aware of any metal dust, filings or if metalized vapor is present as these may cause damage to your drives:

- 1) Dust accumulating on electronic components may cause overheating problems and shorten the service life of the drive.
- 2) Conductive dust may damage the circuit board and may cause the drive to explode.

Solution:

Install the GS30 drive in a suitable enclosure and protect it from dust. Clean the cabinet and ventilation filter regularly for good ventilation.

WIRING AND INSTALLATION PROBLEM

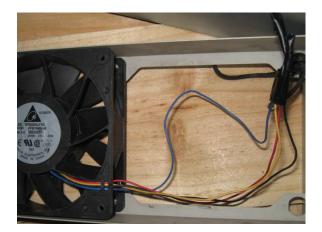

When wiring the GS30 drive, the most common problems are connection to the wrong terminal or poor wiring practice. Please be aware of the possible damage that poor wiring practice may cause to your GS30 drive:

- 1) Screw terminals where the wire is not fully inserted or the terminal screw is not adequately tightened may result in sparking or high temperature due to a high resistance connection.
- 2) If circuit boards in the GS30 drive have been modified, components on the affected boards may have been damaged.

Solution:

Inspect all power and control terminal connections in the GS30 drive to ensure adequate wire insertion. Do not attempt to disassemble or repair control boards in the GS30 drive.

DIGITAL INPUT/OUTPUT TERMINAL PROBLEMS

Problems with digital I/O are usually the result of improper termination, or failure to segregate control wiring from power wiring. This may result in errant signals due to induced voltage, capacitive coupling or electrical noise. Incorrect voltage levels applied to the digital I/O terminals can damage the I/O circuitry of the drive.

• Input/Output circuit may burn out when the terminal usage exceeds its limit.

Solution:

Refer to the user manual for multi-function input output terminals usage and follow the specified voltage and current. DO NOT exceed the specification limits.
