Analog I/O Modules Overview

There are 19 analog I/O modules that can be used in local and remote I/O bases. The specifications and wiring diagrams for these modules are found in this chapter. Each analog I/O module is identified as an "Input", "Output", or "Input/Output" module using the color coding scheme shown below. A blue bar on the front panel signifies an Input I/O module, a red bar signifies an Output I/O module and a white bar signifies a combination Input/Output module.

How to Access the Analog I/O Modules

With the Do-more PLC, the WX and WY memory addresses are assigned to exchange analog data with the analog I/O modules. (WX = Analog input data, WY = Analog output data and setup data) X addresses are also assigned to some analog I/O modules to indicate the status of those analog I/O modules.

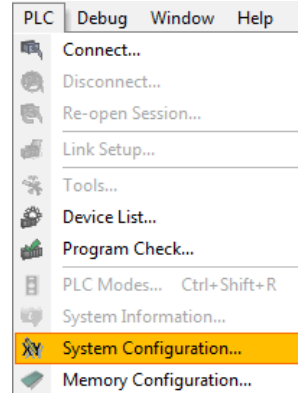

The following table shows how many X, WX and WY addresses are assigned to each analog I/O module type.

Analog I/O Modules Overview- continued

You can check which X, WX and WY addresses are assigned to each analog I/O module in the I/O Mapping tab of the System Configuration window, as shown below.

Select the pull-down menu PLC > System Configuration to open the System Configuration window and click the I/O Mapping tab.

The screenshot shows the 'System Configuration' window with the 'I/O Map' tab selected. The window has a tree view on the left and a table on the right. Red boxes and arrows highlight specific elements: 'I/O Slot Number' points to the 'Slot' column, 'Module ID' points to the 'Mod ID' column, and 'Assigned X, WX and WY Addresses' points to the mapping cells in the table. The table shows slot 0 with module ID 3E and slot I/O 4X / 4WX, with X addresses X0-7, WX addresses WX0-3, and WY address WY0-1. Slots 2-7 are empty.

Manual Mode Instructions: Automatically assigned addresses are shown in gray. Manually assigned addresses are shown in black. Map range overlaps are errors, and are shown in red. Map values that exceed memory config are shown in bold red. Clear manual entry to return it to auto.

F2-04AD-1(L) Analog Input

F2-04AD-1(L) 4-Channel Analog Current In	
Number of Channels	4, single ended (1 common)
Input Ranges	4–20mA current
Resolution	12-bit (1 in 4096)
Active Low-pass Filtering	-3dB at 120Hz, 2 poles (-12dB per octave)
Input Impedance	250Ω ±0.1%, 1/2W current input
Absolute Maximum Ratings	-40mA to +40mA, current input
Converter Type	Successive approximation
Conversion Time (PLC Update Rate)	4 channels per scan maximum
Linearity Error (End to End)	±1 count (0.025% of full scale) maximum
Input Stability	±1 count
Full Scale Calibration Error (not incl. offset error)	±12 counts max., @ 20mA current input
Offset Calibration Error	±7 counts max., @ 4mA current input
Step Response	F2-04AD-1: 4.9 ms to 95% of F.S. change F2-04AD-1L: 4ms to 95% of F.S. change
Maximum Inaccuracy	±0.5% @ 77°F (25°C) ±0.65% 32° to 140°F (0° to 60°C)
Accuracy vs Temperature	±50ppm/°C maximum full scale (Including max. offset change)

Recommended Fuse	0.032 A, Series 217 fast-acting, current inputs
Base Power Required 5 VDC	F2-04AD-1: 100mA F2-04AD-1L: 50mA
External Power Supply	F2-04AD-1: 5 mA maximum, +10 to +30VDC F2-04AD-1L: 90mA maximum, +10 to +15VDC
Operating Temperature	32° to 140°F (0° to 60°C)
Storage Temperature	-4° to 158°F (-20° to 70°C)
Relative Humidity	5 to 95% (non-condensing)
Environmental Air	No corrosive gases permitted
Vibration	MIL STD 810C 514.2
Shock	MIL STD 810C 516.2
Noise Immunity	NEMA ICS3-304
Terminal Type (included)	Removable; D2-8IOCON
ZIPLink Module	ZL-RTB20 (Feedthrough)
ZIPLink Cable	ZL-D2-CBL10 (0.5 m) ZL-D2-CBL10-1 (1.0 m) ZL-D2-CBL10-2 (2.0 m)

One count in the specification table is equal to one least significant bit of the analog data value (1 in 4096).
Note 1: Shields should be grounded at the signal source.

More than one external power supply can be used provided all the power supply commons are connected. A Series 217, 0.032A, fast-acting fuse is recommended for 4–20 mA current loops. If the power supply common of an external power supply is not connected to 0 VDC on the module, then the output of the external transmitter must be isolated. To avoid “ground loop” errors, recommended 4–20 mA transmitter types are: 2 or 3 wire - Isolation between input signal and power supply or 4 wire - Isolation between input signal, power supply, and 4–20 mA output.

Setting the Module Jumpers

There are two channel selection jumpers, labeled +1 and +2, that are used to select the number of channels that will be used. See the figure below to find the jumpers on your module. The module is set from the factory for four channel operation. Any unused channels are not processed, so if you only select channels 1 thru 3, channel 4 will not be active. The following table shows how to use the jumpers to select the number of channels. Unused jumpers can be stored on a single post to prevent losing them.

Yes = Jumper Installed No = Jumper Removed

F2-04AD-1(L) Addressing

The Do-more CPU module assigns the following memory addresses to this module.

F2-04AD-1(L) X Addressing	
Address	Description
Xn	On when the external 24VDC input power is missing or terminal block is removed.
Xn+1	On when the external 24VDC input power is missing or terminal block is removed. (This address stays off if Channel 2 input is not used)
Xn+2	On when the external 24VDC input power is missing or terminal block is removed. (This address stays off if Channel 3 input is not used)
Xn+3	On when the external 24VDC input power is missing or terminal block is removed. (This address stays off if Channel 4 input is not used)
Xn+4	Not used
Xn+5	Not used
Xn+6	Not used
Xn+7	Not used

F2-04AD-2(L), Analog Input

F2-04AD-2(L) 4-Channel Analog Voltage In	
Number of Channels	4, single ended (1 common)
Input Ranges	0 to 5 V, 0 to 10 V, ±5V, ±10VDC
Resolution	12 bit (1 in 4096) uni-polar 13 bit (1 in 8191) bi-polar
Active Low-pass Filtering	-3 dB at 80 Hz, 2 poles (-12 dB per octave)
Input Impedance	>20M Ω
Absolute Maximum Ratings	-75 to +75 VDC
Converter Type	Successive approximation
Conversion Time (PLC Update Rate)	4 channels per scan maximum
Linearity Error (End to End)	±1 count (0.025% of full scale) maximum ±2 counts maximum (bi-polar)
Input Stability	±1 count
Full Scale Calibration Error (not incl. offset error)	±3 counts maximum
Offset Calibration Error	±1 count maximum (0V input)
Step Response	F2-04AD-2: 8.2 ms to 95% of F.S change F2-04AD-2L: 10ms to 95% of F.S change

Maximum Inaccuracy	±0.1% @ 77°F (25°C) ±0.3% 32° to 140°F (0° to 60°C)
Accuracy vs. Temperature	±50ppm/ °C full scale calibration change (Including maximum offset change)
Base Power Required 5VDC	F2-04AD-2: 110mA F2-04AD-2L: 60mA
External Power Supply	F2-04AD-2: 5mA maximum, +10 to +30 VDC F2-04AD-2L: 90mA maximum, +10 to +15 VDC
Operating Temperature	32° to 140°F (0 to 60°C)
Storage Temperature	-4° to 158°F (-20° to 70°C)
Relative Humidity	5 to 95% (Non-condensing)
Environmental Air	No corrosive gases permitted
Vibration	MIL STD 810C 514.2
Shock	MIL STD 810C 516.2
Noise Immunity	NEMA ICS3-304
Terminal Type (included)	Removable; D2-8IOCON
ZIPLink Module	ZL-RTB20 (Feedthrough)
ZIPLink Cable	ZL-D2-CBL10 (0.5 m) ZL-D2-CBL10-1 (1.0 m) ZL-D2-CBL10-2 (2.0 m)

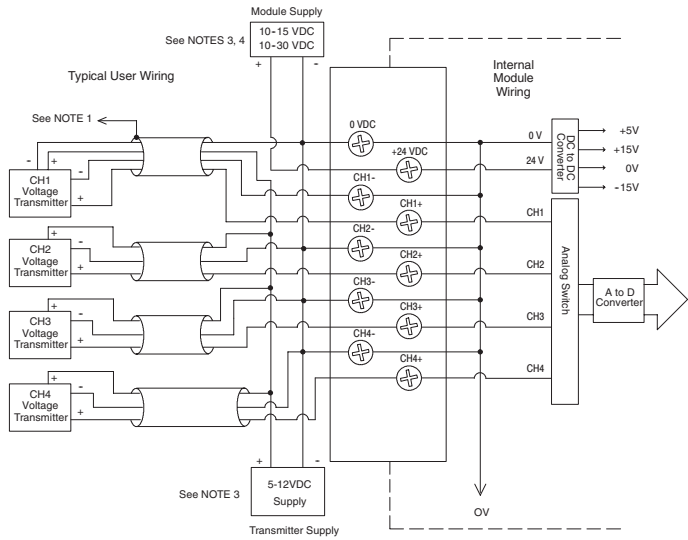

One count in the specification table is equal to one least significant bit of the analog data value (1 in 4096).

Note 1: Shields should be grounded at the signal source.

Note 2: Unused inputs should be jumpered together (i.e. CH4- to CH4+).

Note 3: More than one external power supply can be used provided the commons are connected together.

Note 4: F2-04AD-2L requires 10–15 VDC input supply.

Setting the Module Jumpers

There are seven jumpers (J8) located on the PC board of this module. The description of each jumper's function is also located on the PC board. These jumpers configure the module for the following options:

- Number of channels: 1 thru 4.
- The input type: 10q or 25q copper RTDs; jPt 100q, Pt 100q or Pt 1000 q RTDs.
- Temperature conversion: 2's complement or magnitude + sign format in Fahrenheit or Celsius.

There are two channel selection jumpers, labeled CH+1 and CH+2, that are used to select the number of channels that will be used. The module is set from the factory for four channel operation. Any unused channels are not processed, so if you only select channels 1 thru 3, channel 4 will not be active.

The following table shows how to use the jumpers to select the number of channels. Unused jumpers can be stored on a single post to prevent losing them.

Yes = Jumper Installed No = Jumper Removed

F2-04RTD Module Jumper Table (Channel)			
Number of Channels	Active Channels	CH+1	CH+2
One	Channel 1	No	No
Two	Channels 1 and 2	Yes	No
Three	Channels 1, 2 and 3	No	Yes
Four	Channels 1, 2, 3 and 4	Yes	Yes

F2-04RTD - continued

The jumpers labeled RTD-0, RTD-1, and RTD-2 are used to select the type of RTD. The module can be used with many types of RTDs. All channels of the module must be the same RTD type.

The default setting from the factory is Pt100q (RTD-2 comes with the jumper removed). This selects the DIN43760 European type RTD. European curve type RTDs are calibrated to DIN43760, BS1905, or IEC751 specifications which is $0.00385 \text{ q/q}^\circ\text{C}$ ($100^\circ\text{C} = 138.5 \text{ q}$).

The jPt100q type is used for the American curve ($0.00392 \text{ q/q}^\circ\text{C}$), platinum 100q RTDs. The 10q and 25q RTD settings are used with copper RTDs.

The following table shows how to arrange the jumpers to set the different input types.

Yes = Jumper Installed No = Jumper Removed

F2-04RTD Module Jumper Table (Input Type)			
RTD Inputs	RTD-0	RTD-1	RTD-2
CU 10Ω	No	No	No
CU 25Ω	Yes	No	No
jPt 100Ω	No	Yes	No
Pt 100Ω	Yes	Yes	No
Pt 1000Ω	No	No	Yes

The last two jumpers, Units-0 and Units-1, are used to set the conversion unit. The 2's complement options are Fahrenheit or Celsius. The module comes from the factory with both jumpers installed. For Fahrenheit, remove Units-1 jumper. For Celsius remove both Units-0 and Units-1 jumpers.

All RTD types are converted into a direct temperature reading in either Fahrenheit or Celsius. The data contains one implied decimal place. For example, a value in WX memory of 1002 would be 100.2°C or $^\circ\text{F}$.

Negative temperatures are represented in 2's complement form.

To view this data format in the Do-more Designer software, select Native.

Note 1: Terminate shields at the respective signal source.

Note 2: Connect unused channels to a common terminal (0V, CH4+, CH4).

Note 3: When using 0–156 mV and 5V ranges, connect (-) or (0) volts terminal to 0V to ensure common mode range acceptance.

Note 4: This module is not compatible with the ZIPLink wiring system.

Note 5: With grounded thermocouples, take precautions to prevent having a voltage potential between thermocouple tips. A voltage of 5V or greater between tips will skew measurements.

Setting the Module Jumpers

There are eight jumpers (J7) and one single jumper (J9) located on the PC board of this module. These jumpers configure the module for the following options:

- Number of channels
- Input type
- Thermocouple or Voltage conversion units
- Calibrate enable

There are two channel selection jumpers, labeled CH+1 and CH+2, that are used to select the number of channels that will be used. The module is set from the factory for four channel operation. Any unused channels are not processed. The following table shows how to use the jumpers to select the number of channels. Unused jumpers can be stored on a single post to prevent losing them.

The jumpers labeled Tc Type 0, Tc Type 1, Tc Type 2, and Tc Type 3 must be set to match the type of thermocouple being used or the input voltage level. This module can be used with many types of thermocouples, so use the following table to determine your settings.

This module comes from the factory with all four jumpers installed for use with a J type thermocouple. For example, to use an S type thermocouple, remove the jumper labeled Tc Type 2. All channels of the module must be the same thermocouple type or input voltage level.

Yes = Jumper Installed No = Jumper Removed

Units-0 and Units-1 jumpers are used to set the conversion unit for either thermocouple or voltage inputs. The options are 2's complement in Fahrenheit or Celsius.

All thermocouple types are converted into a direct temperature reading in either Fahrenheit or Celsius. The data contains one implied decimal place. For example, a value in WX memory of 1002 would be 100.2°C or °F.

For thermocouple ranges which include negative temperatures (J,E,K,T,N), the display resolution is from -3276.7 to +3276.7. For positive-only thermocouple ranges (R,S,B,C), the display resolution is 0 to 6553.5. Negative temperatures are represented in 2's complement form.

F2-04THM - continued

The 2's complement data format may be required to correctly display bipolar data on some operator interfaces. This data format could also be used to simplify averaging a bipolar signal. To view this data format in the Do-more software, select Native.

For unipolar thermocouple ranges (R,S,B,C), 2's complement should be selected.

This module comes with both jumpers installed. For Fahrenheit remove Units-1 jumper. For Celsius remove both Units-0 and Units-1 jumpers. Use the following table to select temperature conversion unit.

Yes = Jumper Installed No = Jumper Removed

F2-04THM Module Jumper Table (Temperature Conversion Unit)		
Temperature Conversion Units	Units-0	Units-1
2's Complement (°F)	Yes	No
2's Complement (°C)	No	No

The bipolar voltage input ranges, $\pm 5V$ or $\pm 156mV$ (see previous page for $\pm 5V$ and $\pm 156mV$ input settings), is converted to a 16-bit 2's complement value.

This module comes with both jumpers installed. Use the following table to select voltage conversion unit. For Example, remove the Units-1 jumper and leave the Units-0 jumper installed for 2's complement conversion. For Fahrenheit remove Units-1 jumper. For Celsius remove both Units-0 and Units-1 jumpers.

Yes = Jumper Installed No = Jumper Removed

F2-04THM Module Jumper Table (Voltage Conversion Unit)		
Voltage Conversion Units	Units-0	Units-1
2's Complement	Yes	No

The Calibrate Enable jumper J9 comes from the factory in the "jumper removed" setting (the jumper is installed over only one of the two pins). Installing this jumper disables the thermocouple active burn-out detection circuitry, which enables you to attach a thermocouple calibrator to the module. To make sure that the output of the thermocouple calibrator is within the 5V common mode voltage range of the module, connect the negative side of the differential voltage input channel to the 0V terminal, then connect the thermocouple calibrator to the differential inputs (for example, Ch 3+ and Ch 3).

For the voltage input ranges, this jumper is inactive and can be installed or removed with no effect on voltage input.

Typical user wiring

F2-02DA-2(L), Analog Output - continued

The F2-02DA-2(L) Analog Output module uses jumpers for selecting the voltage ranges for each channel. The range of each channel can be independently set. Available operating ranges are 0–5 V, 0–10 V, ± 5 V, and ± 10 V. There are three jumpers for each channel. Two sets are on the top board, and the third set is along the edge of the bottom board with the black D-shell backplane connector. Install or remove these jumpers to select the desired range.

- Two of the top board jumpers are labeled “UNI/ ± 5 ” and there is one for each channel. These jumpers are used in conjunction with the “BI-P 0-5” jumpers to determine output voltage polarity and range.
- The two bottom board jumpers are labeled “UNI” and there is one for each channel. These jumpers determine the format of the channel output data, and the effect of their settings is independent from that of the other jumpers on the module. With a UNI jumper removed, the corresponding channel requires data values in the range of ± 2047 . With a UNI jumper installed, the channel requires data values in the range of 0 to 4095.
- The other two top board jumpers are labeled “BI-P 0-5” and there is one for each channel. These jumpers are used in conjunction with the “UNI/ ± 5 ” jumpers to determine output voltage polarity and range.

NOTE: It is important to set the module jumpers correctly. The module will not operate correctly if the jumpers are not properly set for the desired voltage range.

F2-02DA-2(L), Analog Output - continued

The table below lists the eight possible combinations of voltage ranges and data formats along with their corresponding jumper settings. For most applications, use one of the four standard selections shown in the shaded blocks in the table. Standard unipolar voltage ranges accept a data format of 0 to 4095. Standard bipolar ranges accept a data format of -2047 to +2047. Unused jumpers can be stored on a single post to prevent losing them.

Yes = Jumper Installed No = Jumper Removed

F2-02DA-2(L) Module Jumper Table					
Voltage Range	Output Data Format	UNI/±5V (Top board)	UNI (Bottom board)	BI-P 0-5V (Top board)	
				BI-P (Bipolar) Position	0-5V Position
0 to 5V	0 to 4095	Yes	Yes	No	Yes
0 to 10V	0 to 4095	Yes	Yes	No	No
0 to 5V	±2047	Yes	No	No	Yes
0 to 10V	±2047	Yes	No	No	No
±5V	±2047	Yes	No	Yes	No
±10V	±2047	No	No	Yes	No
±5V	0 to 4095	Yes	Yes	Yes	No
±10V	0 to 4095	No	Yes	Yes	No

For example, to select settings of “±5V” voltage range with a “±2047” output data format for channel 1, refer to the table above and the figure on the previous page and arrange the jumpers as follows:

- Install the “CH1” “UNI/±5V” jumper.
- Remove the “CH1-UNI” jumper. Store the jumper so it does not get lost by placing it on one pin.
- Install the “CH1” “BI-P 0-5” jumper in the BI-P (bipolar) position on the left and center pins.

The non-standard selections in the table provide the opposite data format for both unipolar and bipolar voltage ranges. If you are using unipolar output (0–5 V or 0–10 V) on one channel and bipolar output (±5V, ±10V) on the other channel, then one of the outputs will use a non-standard data format.

Setting the Module Jumpers

The F2-02DAS-2 Analog Output module uses jumpers for selecting the voltage range for each channel. The range of each channel can be independently set. The available operating ranges are 0–5 V and 0–10 V.

There is one jumper for each channel. Install or remove these jumpers to select the desired range. See the figures below to find the jumpers on your module. The module is set from the factory for the 0–5 V range. Refer to the following table in order to configure module differently. Unused jumpers can be stored on a single post to prevent losing them.

NOTE: It is important to set the module jumpers correctly. The module will not operate correctly if the jumpers are not properly set for the desired voltage range.

Yes = Jumper Installed No = Jumper Removed

F2-4AD2DA, Analog Input/Output - continued

One count in the specification table is equal to one least significant bit of the analog data value (1 in 4096).

Note 1: Shields should be connected at their respective signal source.

Note 2: Unused channel should remain open for minimum power consumption.

Note 3: More than one external power supply can be used provided the power supply commons are connected.

Note 4: A Series 217, 0.032A fast-acting fuse is recommended for 4–20 mA current input loops.

Note 5: If the power supply common of an external power supply is not connected to 0 VDC on the module, then the output of the external transmitter must be isolated. To avoid “ground loop” errors, recommended 4–20 mA transmitter types are: 2 or 3 wire - Isolation between input signal and power supply or 4 wire - Isolation between input signal, power supply, and 4-20 mA output.

Note 6: If an analog channel is connected backwards, then erroneous data values will be returned for that channel.

Note 7: To avoid small errors due to terminal block losses, connect 0 VDC, IN-, and OUT- on the terminal block as shown. The module’s internal connection alone of these nodes is not sufficient to permit module performance up to the accuracy specifications.

Note 8: Choose an output transducer resistance according to the maximum load/power listed in the Output Specifications.

WXn: Starting WX address assigned to this module

The Do-more CPU module assigns the following memory addresses to this module.

The resolution of each analog input channel can be selected separately. Available resolutions are 12 bit (0 to 4095), 14 bit (0 to 16383) and 16 bit (0 to 65535). You need to use the memory address WYn+4 to select the resolutions. Please refer to the next page for details.

NOTE 1: The data format of the WX addresses is 'Signed Word'. They store -32768 to 32767 as default. To read and write 0 to 65535 into these memory addresses, use the casting ':U' (':U' is the casting for 'Unsigned' format). For instance, if you selected the 16 bit resolution for the first analog input channel and WX0 is assigned to the channel, use 'WX0:U' to access this memory address in the ladder program and other tools in Do-more Designer.

Input Configuration Using Do-more Designer Version 1.1 or Newer

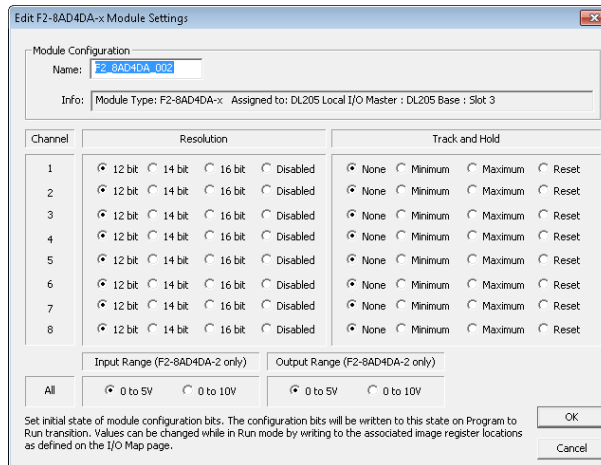

Using the Module Configurations section of the Do-more Designer System Configuration, each of the eight input channels can be individually configured for resolutions: 12, 14, or 16 bit, configured for track and hold options: None (no hold), Minimum, Maximum, or Reset held value, or each input can be individually disabled.

From the System Configurations page, select Module Configuration(s) in the tab on the left. The screen below will appear showing the modules that are pre-configurable. Select the Type F2-8AD4DA-x in the table and click the Edit Config button on the right hand side.

Once the Edit Config button is selected, the Module Settings page shown below will open.

From this page each input channel can be configured with Resolution and/or Track and Hold options. Select the radial button next to the desired option for each input and select the OK button when done.

NOTE: The Input and Output Range selections are for the F2-8AD4DA-2 module only.

Input Resolution Selection (WYn+4)

If not using Do-more Designer version 1.1 or newer, each of the eight input channels can be individually configured for 12, 14, or 16 bit resolution or disabled with memory address WYn+4 (WYn: Starting WY address assigned to this module). Two (2) bits in this memory address are assigned to each analog input channel.

Input Track and Hold Selection (WYn+6)

The track and hold feature for each of the eight inputs can be individually configured for minimum, maximum, no hold, or reset held value with memory address WYn+6 (WYn: Starting WY address assigned to this module). This configuration can be changed "on the fly" while the program is running. Two (2) bits in this memory address are assigned to each analog input channel.

Track and Hold Minimum Value	0	1	Maintains lowest measured value
Track and Hold Maximum Value	1	0	Maintains highest measured value
Reset Track and Hold Value	1	1	Resets previously held input value

The HEX data format is used to set up the track and hold option as seen in the following example.

Example: An F2-8AD4DA-1 is installed in slot 0 and WY6 is used for the track and hold selection. Input channel track and hold settings: ch 1-3 = none, ch 4-5 = minimum, ch 6-7 = maximum, ch 8 = reset. In this case, 0xE940 needs to be written into WY6.

F2-8AD4DA-2 WX Addressing	
Address	Description
WXn	Channel 1 Input Data (0 to 4095, 0 to 16383 or 0 to 655351)
WXn+1	Channel 2 Input Data (0 to 4095, 0 to 16383 or 0 to 655351)
WXn+2	Channel 3 Input Data (0 to 4095, 0 to 16383 or 0 to 655351)
WXn+3	Channel 4 Input Data (0 to 4095, 0 to 16383 or 0 to 655351)
WXn+4	Channel 5 Input Data (0 to 4095, 0 to 16383 or 0 to 655351)
WXn+5	Channel 6 Input Data (0 to 4095, 0 to 16383 or 0 to 655351)
WXn+6	Channel 7 Input Data (0 to 4095, 0 to 16383 or 0 to 655351)
WXn+7	Channel 8 Input Data (0 to 4095, 0 to 16383 or 0 to 655351)

WXn: Starting WX address assigned to this module

The resolution of each analog input channel can be selected separately. Available resolutions are 12 bit (0 to 4095), 14 bit (0 to 16383) and 16 bit (0 to 65535). You need to use the memory address WYn+4 to select the resolutions. Please refer to the next page for details.

NOTE 1: The data format of the WX addresses is 'Signed Word'. They store -32768 to 32767 as default. To read and write 0 to 65535 into these memory addresses, use the casting ':U' (':U' is the casting for 'Unsigned' format). For instance, if you selected the 16 bit resolution for the first analog input channel and WX0 is assigned to the channel, use 'WX0:U' to access this memory address in the ladder program and other tools in Do-more Designer.

WYn+3	Channel 4 Output Data (0 to 655352)
WYn+4	Input Resolution Selection
WYn+5	Input and Output Ranges Selection
WYn+6	Input Track and Hold Selection

WYn: Starting WY address assigned to this module

NOTE 2: The data format of the WY addresses is 'Signed Word'. They store -32768 to 32767 as default. To read and write 0 to 65535 into these memory addresses, use the casting ':U' (':U' is the casting for 'Unsigned' format). For instance, if WY0 is assigned to the first analog output channel, use 'WY0:U' to access this memory address in the ladder program and other tools in Do-more Designer.

Input Configuration Using Do-more Designer Version 1.1 or Newer

Using the Module Configurations section of the Do-more Designer System Configuration, each of the eight input channels can be individually configured for resolutions: 12, 14, or 16 bit, configured for track and hold options: None (no hold), Minimum, Maximum, or Reset held value, or each input can be individually disabled. Input and output ranges can also be configured for 0 to 5V or 0 to 10V in this section.

From the System Configurations page, select Module Configuration(s) in the tab on the left. The screen below will appear showing the modules that are pre-configurable. Select the Type F2-8AD4DA-x in the table and click the Edit Config button on the right-hand side.

Once the Edit Config button is selected, the Module Settings page shown below will open. From this page each input channel can be configured with Resolution and/or Track and Hold options. Input/output range options are also available. Select the radial button next to the desired options and select the OK button when done.

Input Resolution Selection (WYn+4)

If not using Do-more Designer version 1.1 or newer, each of the eight input channels can be individually configured for 12, 14, or 16 bit resolution or disabled with memory address WYn+4 (WYn: Starting WY address assigned to this module). Two (2) bits in this memory address are assigned to each analog input channel.

The HEX data format is used to set up the input resolution as seen in the following example.

Example: An F2-8AD4DA-2 is installed in slot 0 and WY4 is used for the input resolution selection. Input channels 1-4 are 12 bit, channel 5 is 14 bit, channel 6 is 16 bit, and channels 7 and 8 are disabled. In this case, 0xF900 needs to be written into WY4.

Input and Output Range Selection (WYn+5)

The range of the eight input channels can be collectively set for 0 to 5V or for 0 to 10V. The range of the four output channels can also be collectively set for either of the same two voltage ranges. The configuration is stored in memory address WYn+5 (WYn: Starting WY address assigned to this module). Only 2 bits in this memory address are used for the setup.

The HEX data format is used to set up the input resolution as seen in the following example.

Example: An F2-8AD4DA-2 is installed in slot 0 and WY5 is used for the input and output resolution selection. Input channel range is set to 0 to 5V and output channel range is set to 0 to 10V. In this case, 0x100 needs to be written into WY5.

Use the MOVE instruction to write the Hex value 0x100 into WY5.
