Overview

Base Hardware

The Productivity® 2000 system is a modular system that requires a base to accommodate the various modules. Bases are available in sizes of 4, 7, 11 and 15 I/O module slots. The base contains additional dedicated slots for the power supply and the CPU unit. You can place any I/O module into any slot without power budget or module type restrictions.

The backplane incorporates a discrete and analog I/O processor, which unloads the I/O module communication task from the CPU. This distributed processing architecture results in outstanding performance at a very low cost. The backplane includes a high-speed communication pathway directly from the CPU to specialty modules and to the discrete and analog module backplane processor.

Up to 8 Remote Slaves (P2-RS and P1-RX) and 4 PS-AMC modules can be connected to a single P2-550 for a remote I/O network. In addition to the P2-RS, P2 CPUs support P1-RX remote bases as well.

The base supports hot swapping and has electronic module keying for each slot.

P2-04B, P2-07B, P2-11B, P2-15B Bases

The P2-04B, P2-07B, P2-11B, and P2-15B are 4, 7, 11, and 15-slot, local, expansion, and remote I/O bases.

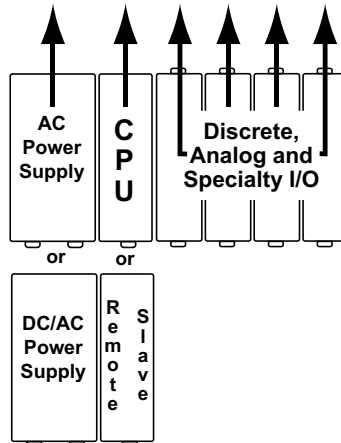

P2-04B 4-Slot Base

NOTE: See Chapter 5 for base dimensions.

Grounding

A good common ground reference (earth ground) is essential for proper operation of the Productivity® 2000 system. One side of all control circuits, power circuits and the ground lead must be properly connected to earth ground by either installing a ground rod in close proximity to the enclosure or by connecting to the incoming power system ground. There must be a single-point ground (i.e. copper bus bar) for all devices in the enclosure that require an earth ground.

Productivity 2000 CPU Modules

Each Productivity2000 system base requires one CPU module be mounted in the controller slot of the unit. The CPU stores and executes the user's program.

P2-622 CPU Ethernet Ports

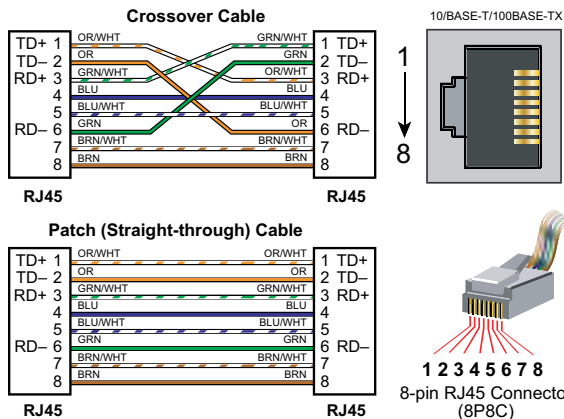

P2-622 Bottom Ports

- Connection to a PC running the ProductivitySuite programming software
- Modbus TCP Client (32 Servers) connections (Modbus requests sent from the CPU)
- Modbus TCP Server (16 Clients) connections (Modbus requests received by the CPU)
- EtherNet/IP Scanner (32 Adaptors)
- EtherNet/IP Adapter (4 scanners) with 8 connections per device.
- Outgoing E-mail
- MQTT Client (4 brokers)

Ethernet Specifications		
Port Name	ETHERNET	REMOTE I/O
Description	Standard transformer isolated Ethernet port with built-in surge protection for programming, online monitoring, firmware, MQTT, Email (SMTP client), Modbus/TCP client/server connections (fixed IP or DHCP) and Ethernet/IP Scanner/Adapter connections..	Standard transformer-isolated Ethernet port with built-in surge protection for connection of ProtoX remote I/O, P2-RS and P1-RX remote slaves, GS Drives with optional communication modules and/or PS-AMC modules. Can be configured as a Secondary multipurpose Ethernet port.
Transfer Rate	RJ45 Yellow LED Off = 10Mbps / On = 100 Mbps	
Port Status LED	RJ45 Green LED Solid when network LINK is established. Flashes when port is active (ACT).	

P2-622 CPU Ethernet Ports

P2-622 Bottom Ports

Remote I/O Port (RJ-45 style connector on bottom of CPU)

- Connection to a Remote I/O network of devices using the Productivity Remote Protocol, e.g. P2-RS, P1-RX, GS Drives, etc.
- Can be user defined and used as a secondary multipurpose ethernet port with the exception that this port does not have Default Gateway or DNS capability.

This feature, currently only available for the P2-622 CPU, allows the Remote I/O port to be user defined enabling the port to function in a similar manner as the External Ethernet port, depending on user configuration.

This will allow the CPU to operate on two different networks, e.g. for IT and OT (operational technology) network separation, with the understanding that **subnets must be different** on the two ports.

Users will be able to discover, go online, perform runtime and stop mode transfers, update firmware, and access the webserver via either or both Ethernet ports (if the Remote I/O port is set to be user defined).

NOTE: If the Remote I/O port is configured as user defined, it will no longer natively support Remote Slaves (P2-RS and P1-RX), AMCs, GS Drives, and Protos X modules.

NOTE: DNS & Default Gateway only work for the External Ethernet port (this affects Email and other ethernet based comms, such as MQTT, that may need to go through a router).

OLED Message Display

The P2-RS incorporates a 4 line x 10 character OLED for system errors and information or for displaying user-defined messages.

OLED characters are 7x12 with a dot pitch of 0.245 mm; 1.72 mm x 2.94 mm.

Wake Up button refreshes timed out display.

NOTE: The OLED display will time-out after approximately 4 hours without interaction. To wake, press ESC button on the front panel.

For user-defined messages, the display is configured using the Productivity Suite Programming Software. An LCD Page instruction allows the user to program text into user-defined tags and display the messages based on the ladder execution.

See the Productivity Suite Programming Software Help Files for complete details.

Setting Remote Slave Address

Each Remote Slave must have a unique address between 1 and 99. The address is set using the two rotary switches located in the base; X10 for setting the tens units and X1 for setting the ones unit.

For example, to set a remote slave address to 21, turn the X10 arrow until it points at number 2 and the X1 arrow until it points at number 1.

Important Notes:

- The factory setting of 00 is not a valid address for the Remote Slave.
- Address selection must be set prior to power-up.
- Slave addresses are read only on power-up.
- If there are duplicate P2-RS slave addresses on the same network, a critical error will be displayed on the CPU.

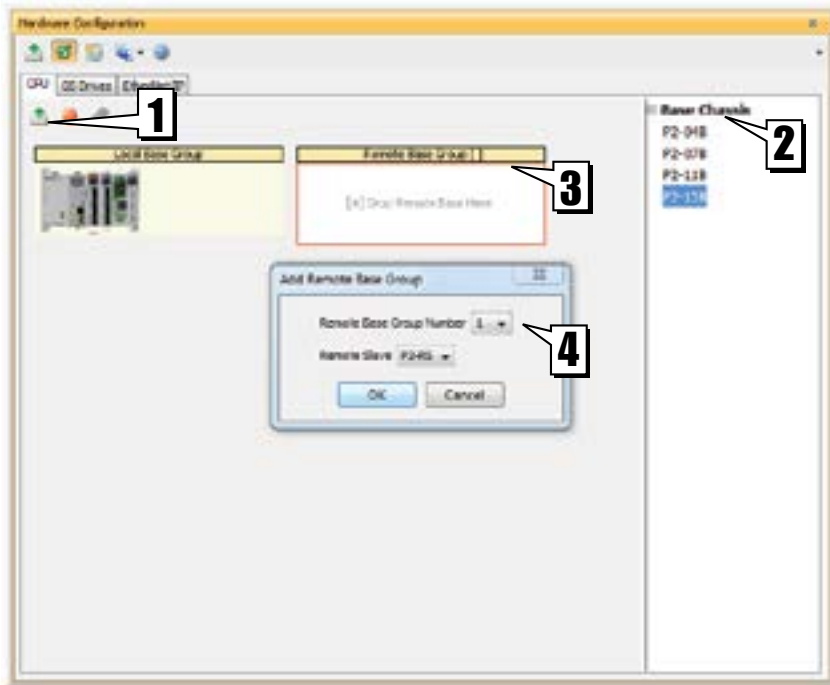

Setting the Remote Slave Address (continued)

It is also necessary to configure the remote addresses using the ProductivitySuite Programming Software.

For example, if connected online to a Productivity® 2000 system with slaves installed, go to Hardware Configuration and select the Read Configuration (1) icon. The CPU will automatically read the addresses of the remote slaves and add them to the configuration.

If setting up offline, go to Hardware Configuration, select CPU Base Groups (2), and then select Remote Base Group (3). In the Add Remote Base Group (4) window, select the same Remote Base Number as set on the rotary switches.

LED Status		
Fault Condition	Fault Status Indication	Operation to Reset Fault
Missing External 24VDC	V1 LED is ON	Apply external 24 VDC
Open Load (Note 1)	"F" LED is ON (Note 2)	Connect the load
Over Temperature or Over Load Current		Turn the output OFF or cycle power
LED Page Shifting		
The "A" LED is ON when the LED states correspond to outputs/faults 1–16. The "B" LED is ON for outputs / faults 17–32.		

Note 1: Open Load Fault is always enabled, but is only valid when output is OFF. If Open Load Fault happens while output is ON, fault will not appear until you turn OFF output.

Note 2: The SEL button cycles between the output status and fault status. If the "F" LED is OFF the numbered LEDs are showing output status. If the "F" LED is ON the numbered LEDs are showing fault status of each output. The "V1" LED is independent of fault or output display.
