

# IEC Limit Switches

## Double Insulated Limit Switches ABP Series

- Featuring an electrically isolated PBT body for corrosive environments
- Single conduit openings in 1/2" NPT or PG13.5
- Conduit openings splined actuator shaft allows very fine adjustment of switch to fit all applications
- Choose from eight different actuators including roller levers, plungers, and wobble sticks

# IEC Limit Switches Accessories

## Replacement Contact Blocks

Easily-installed replacement contact blocks fit both heavy-duty IEC and double-insulated limit switches, including mini-DIN models.

*Note: Limit switches come standard with snap-action contacts ([AGZ11-SWITCH](#).) To replace contact block, remove limit switch cover. Carefully remove old contact block and install replacement. Contact blocks are supplied with an adapter to fit into larger ABM and ABP switches. Remove this adapter when installing contacts in mini-DIN AAP models.*

| Replacement Contact Blocks   |        |                                           |                      |

**Note:** See the Bar Charts page of this section for more information.

### Replacement actuator levers for heavy-duty IEC models

Easily-replaceable actuators for E42 and E52 model limit switches.

**Note:** These models have an E42 or E52 in the part number, for example, [ABM1E42Z11](#).

### AGE52-LEVER

(Replacement lever shown installed on [ABM5E52Z11](#) limit switch)

### AGE44-LEVER

<sup>1</sup> Minimum temperatures assume that the atmosphere is free of moisture, which could cause moving parts to freeze up.

<sup>2</sup> Some types of actuators, such as a long, heavy spring with the adjustable actuator fully extended, may not work properly if installed in a horizontal position.

<sup>3</sup> Positive opening in a snap-action contact block is performed by a rigid mechanism that forces the N.C. contact to open in case the snap-action mechanism fails.

This would provide protection if, for example, the contacts became "welded" together by excessive current rush. Generally, positive opening is not considered to work properly on switches with actuators that are not a solid design (such as a spring or rubber roller), despite the fact that the contact block itself has positive opening. In order to be considered as having positive opening, a switch must not have flexible components between actuator actioning points and the electrical contact.

<sup>4</sup> This is the speed at which snap-action contact blocks are tested. There is no minimum operating speed for snap-action contacts because the speed has no influence on the switch action. When using spring actuators, the changeover time may vary from 1ms to 3ms from maximum to minimum operating speed.

<sup>5</sup> Slow-action contacts must not be operated at very low speeds because of the tendency to maintain the arc if contacts are not rapidly separated.

# IEC Limit Switches Bar Charts

## Limit switch types

**Snap action contact:** A contact element in which the contact motion is independent of the speed of the actuator. This feature ensures reliable electrical performance even in applications involving very slow moving actuators.

**Slow make/slow break contacts:** A contact element in which the contact motion is dependent on the actuator speed.

## Terminal identification (IEC)

Each terminal is marked with two digits. The first digit indicates the pole (circuit). The second digit indicates the type of contact.

\_1-\_2 is N.C., \_3-\_4 is N.O.  
so 11-12, 21-22 are N.C., while 13-14, 23-24 are N.O.

Make-before-break (overlapping) SPDT: the N.O. contact closes before the N.C. contact opens. (See ex: Y11)

Break-before-make (offset) SPDT: the N.C. contact opens before the N.O. contact closes. (See ex: X11)

Simultaneous make and break SPDT: the N.C. contact opens at the same time as the N.O. contact closes. (See ex: Z11)

## Contacts Configuration

### Z11 Snap Action Contacts

1 N.O. and 1 N.C.

A = Max. travel of the operator in mm or degrees  
B = Tripping travel of both contacts on actuation  
C = Tripping travel of both contacts on release  
D = Differential travel (between actuation and release)  
P = Point from which positive opening is assured during actuation
