Overview

ProSense FSC series digital flow sensors monitor liquid media and provides two outputs that can be configured for switching, frequency, or analog signals for either flow rate or temperature.

Output OUT1 selection options:

- Frequency or switching output for flow or temperature

Output OUT2 selection options

- Analog or switching output for flow or temperature

Configuration and process variable monitoring are accomplished with the push buttons and a 4-digit, two-color digital display. The ProSense FSC series sensing principle is based on differential pressure which ensures an extremely fast response time and allows for a precise flow measurement.

The ProSense FSC series flow transmitters are ideal for applications with rapid temperature changes or where fast response time is required, such as:

- Machine tool coolant flow
- HVAC cooling water flow
- Injection molding cooling water flow

See www.AutomationDirect.com for wiring options.

Installation*:

For proper operation, please observe the flow direction arrows on the body of the sensor. The mounting orientation does not effect the operation of the unit.

* Integral check valve design allows the sensor to be mounted in any position.

1. Ferromagnetic materials in the surrounding environment should be at least 50mm from the housing of the unit.
2. Ferromagnetic piping may be used on the inlet and outlet connections.
3. Do not operate the unit in the vicinity of magnetic constant and alternating fields (e.g. welding systems).
4. If the sensors are installed side by side, observe a minimum distance of 50mm between the sensor axes.
5. Avoid downward flow in unpressurized pipes.

prosense® FSC Series Digital Flow Sensors

Operation

The flow sensor utilizes a spring-supported piston that is lifted by the flowing medium. The flow rate is determined by monitoring the piston position and converting it to an analog output signal. The spring resistance forces the piston to return to its original position with decreasing flow, preventing backflow. This allows the sensor to be mounted in any position (horizontally or vertically) and function as a check valve.

Function

The analog signal for water (20°C [68°F]) is linear from 4.3 mA to 20mA (4mA = no flow). For an output signal >20mA the flow rate is above the final value of the measuring range.
