GENERAL DATA						
Carrier frequency	13.56 MHz					
Max. transmission speed	53 kbit/s if fast custom commands are used, 26.5 kbit/s otherwise					
Type of integrated circuit	NXP I-Code SLI-X2			Fujitsu MB89R118C		
Compatible standard	ISO 15693			ISO 15693 / ISO 18000-3 (Partly not supported. Refer to table "Note on Using MB89R118C" on page 7.)		
Memory type	EEPROM			FRAM		
Memory size	320 Bytes			2048 Bytes		
Read/write distance max. (with RLS-1301-320)	34 mm	40 mm	58 mm	35 mm	42 mm	54 mm

MEMORY INFORMATION		
Unique identifier	8 Bytes	
Organization	80 blocks × 4 Bytes	256 blocks × 8 Bytes
User memory (R/W)	79 blocks, 316 Bytes	250 blocks, 2000 Bytes
Configuration memory	1 blocks, 4 Bytes	6 blocks, 48 Bytes
Data retention period (< 55°C)	> 50 years	> 30 years
Number of "write" cycles	10 ⁵	10 ¹²
Number of "read" cycles	unlimited	

MECHANICAL DATA

Protection degree	IP68 & IP69K
Ambient temperature range TA*	-25 ... +80°C
Storage temperature range TS**	-40 ... +90°C
Thermal cycling reliability @ 90°C	1000 cycles / 1000 hours
Housing material	PPA (Polyphthalamide)
Weight	See table "Available types" below
Tightening torque	max. 1 Nm

* Read/write operations possible

** Data retention and mechanical stability limit

MEMORY OF TRANSPONDERS

The EEPROM has a memory capacity of 2560 bits and is divided in two areas. One user area of 79 blocks and one counter block and a system area not stored in EEPROM, that means a total of 80 blocks of 4 bytes each. The block is the smallest unit used to read and write the EEPROM memory.

EEPROM memory configuration

Area	Block No.	Details	Read Access	Write Access
User memory (316 bytes)	00 _h to 4E _h	User memory	✓	✓
User memory (4 bytes)	4F _h	Counter	Special access. See "16-bit counter feature"	Special access. See "16-bit counter feature"
System memory	N/A	UID (64 bits), Access Control Info. Passwords (AFI, EAS) Write protection Destroy Enable privacy 32-byte ECC sign.	See "List of command" features for more details	See "List of command" features for more details

User memory Direct read access to blocks of this memory is always possible. Direct write access to blocks of this memory is possible depending on the value of its corresponding block security status bit.

System memory Direct read or write access to blocks of this memory area is not possible.

Structure of a single user memory block

MSB			LSB	
Byte 3	Byte 2	Byte 1	Byte 0	

The FRAM has a memory capacity of 16,384 bits and is divided in two areas. One user area of 250 blocks and one system area of 6 blocks, that means a total of 256 blocks of 8 bytes each. The block is the smallest unit used to read and write the FRAM memory.

FRAM memory configuration

Area	Block No.	Details	Read Access	Write Access
User memory (2,000 bytes)	00 _h to F9 _h	User memory	✓	✓
System memory (48 bytes)	FA _h	UID (64 bits)	Inv. Cmd	*
	FB _h	AFI, DSFID, EAS, security status	Get System Info Cmd EAS Cmd	Write AFI Cmd Write DSFID Cmd Write EAS Cmd
	FC _h to FE _h	Block security status	Get Multiple Block Security Status Cmd	Lock Block Cmd (OTP)

User memory Direct read access to blocks of this memory is always possible. Direct write access to blocks of this memory is possible depending on the value of its corresponding block security status bit.

System memory Direct read or write access to blocks of this memory area is not possible.

SPECIAL FEATURES

RTH-DxxQA-NFO

Name	Description
EAS*	Electronic Article Surveillance
AFI	Application Family Identifier
DSFID	Data Storage Format Identifier

AFI, DSFID, and EAS bits are written at the IC manufacturer factory, and can be updated and locked (disable to write) with specific commands. Only EAS bit cannot be locked. The LSB of Byte 7 holds the EAS bit. If the Electronic Article Surveillance is active (LSB = "1"), the transponder responds to an EAS command, otherwise it remains silent.

Structure of memory block "FB_n"

MSB				LSB			
Byte 7	Byte 6 to Byte 4			Byte 3	Byte 2	Byte 1	Byte 0
EAS Status*	RFU			DSFID Lock Status	AFI Lock Status	DSFID	AFI

The security status of the DSFID and AFI Identifier are stored in the Byte 3 and Byte 2 of the system memory blocks "FB_n" and are OTP (one time programmable).

* Features not available with Contrinex RWMs (RLx-xxxx-xxx)

SECURITY AND PROTECTIONS

RTH-DxxQA-NFO

Description

Unique identifier (UID) for each transponder
Lock mechanism for each user memory block (write protection)
Lock mechanism for DSFID, AFI and EAS*
Password (32-bits) protected EAS/AFI functionality*
Initial state of the EAS/AFI passwords 00000000 _h
Destroy SLI-X2*
Enable Privacy*
32-byte ECC signature*

* Features not available with Contrinex RWMs (RLx-xxxx-xxx)

The security status of the user memory is stored in the block security status bit located in the system memory blocks "FC_n" to "FF_n".

A user memory is unlocked when the corresponding block security status bit is "0". It is locked (disable to write) when the corresponding block security status bit is "1".

The user memory, DSFID and AFI protections are OTP (one time programmable).

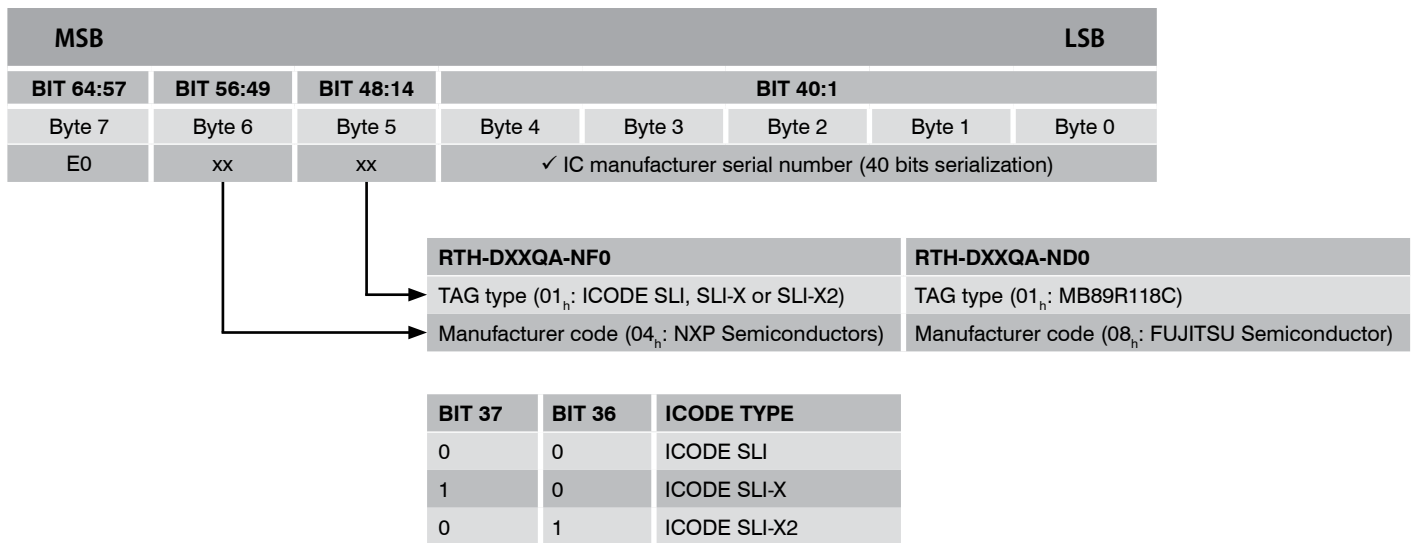

Structure of memory block "FC_n" to "FF_n"

Block No.	Block Security Status (BSS)														LSB			
	Byte 7								Byte 6 to Byte 1			Byte 0						
FC _n	3F	3E	3D	3C	3B	3A	39	38	3	2	1	0	FD ₃	02	01	00

FE _n	BF	BE	BD	BC	BB	BA	B9	B8	87	86	85	84	83	82	81	80	
FF _n	RFU (6 bits)						F9	F8	C7	C6	C5	C4	C3	C2	C1	C0	

RTH-DxxQA-ND0

UNIQUE IDENTIFICATION NUMBER (UID)

The 64-bits unique identification number (UID) is programmed during the production process according to ISO/IEC 15693-3 and cannot be changed afterwards. The type of TAG and manufacturer code are part of the UID: bytes 5 and 6 respectively.

LIST OF COMMANDS

	Command Name	Command Code	Description	Rxx-xxxx-		
				x20	320	NIS
Mandatory ISO 15693	Inventory	01 _h	Execute the anti-collision sequence and return UID	✓	✓	✗
	Stay Quiet	02 _h	Enter the Quiet state	✓	✗	✗
Optional ISO 15693	Read Single Block	20 _h	Read the requested 1 block data in the user/system memory	✓	✓	✓
	Write Single Block	21 _h	Write the requested 1 block data in the user memory	✓	✓	✓
	Lock Block	22 _h	Lock permanently the requested 1 block in the user memory	✓	✗	✗
	Read Multiple Blocks	23 _h	Read the requested multiple block data in the user/system memory	✗	✗	✗
	Select	25 _h	Enter the Select state	✓	✗	✗
	Reset to ready	26 _h	Enter the Ready state	✓	✗	✗
	Write AFI	27 _h	Write AFI (Application Family Identifier) value into EEPROM	✓	✗	✗
	Lock AFI	28 _h	Lock permanently AFI value	✓	✗	✗
	Write DSFID	29 _h	Write DSFID (Data Storage Format Identifier) value into EEPROM	✓	✗	✗
	Lock DSFID	2A _h	Lock permanently DSFID value	✓	✗	✗
	Get System Information	2B _h	Read the system information value (UID, DSFID, AFI, number of bytes per block, etc)	✓	✗	✓
Get Multiple Block Security Status	2C _h	Read the block security status stored in system area	✗	✗	✗	
–	2D _h to 9F _h	Reserved for future use	–	–	–	

LIST OF COMMANDS

	Command Name	Command Code	Description	Rxx-xxxx-		
				x20	320	NIS
Custom ISO 15693	RTH-DxxQA-NF0					
	Inventory Read	A0_h	Execute the anti-collision sequence and return the requested n blocks data in the user memory	x	x	x
	Fast Inventory Read	A1_h	Fast response Inventory Read command	x	x	x
	Set EAS	A2_h	Set EAS bit to "1"	x	x	x
	Reset EAS	A3_h	Set EAS bit to "0"	x	x	x
	Lock EAS	A4_h	Lock permanently the EAS bit to its current value	x	x	x
	EAS Alarm	A5_h	When EAS bit is "1", reply 13 bytes of data (Flags, EAS, IC Mfg. code, UID and CRC16)	x	x	x
	Write EAS ID	A6_h	Write a new EAS identifier	x	x	x
	Get NXP System Information	AB_h	Provide information about IC access conditions and supported features	x	x	x
	Password Protect EAS/AFI	A6_h	EAS/AFI Password has to be transmitted before with a Set Password command	x	x	x
	Get Random Number	B2_h	Get a random number calculated in the transponder	✓	x	✓
	Set Password	B3_h	Get access to the different protected functionalities (EAS/AFI) in function of the password identifier used	✓	x	✓
	Write Password	B4_h	Write a new password (EAS/AFI) into the system memory in function of the password identifier used	✓	x	x
	Lock Password	B5_h	Lock permanently one password (EAS/AFI) in function of the password identifier used	✓	x	x
	Protect Page	B6_h	Set the read and write access condition pagewise	✓	x	x
	Lock Page Protection	B7_h	Lock permanently the read and write access condition pagewise	✓	x	x
	Destroy SLI-X2	B9_h	Destroy permanently the transponder ISO15693 air interface	✓	x	x
	Enable Privacy	BA_h	Enable the SLI-S privacy mode	x	x	x
	64 Bit Password Protection	BB_h	If 64-Bit Password Protection is enabled both read + write passwords are required to access read and write protected blocks (pages)	✓	x	x
	Stay Quiet Persistent	BB_h	Upon reception, the label IC enters the persistent quiet state and will not send back a response. Stay quiet persists after power-off in case power off time < IC persistence time	x	x	x
	Read signature	BD_h	Return an IC specific, 32-byte ECC signature, to verify NXP Semiconductors as the silicon vendor	x	x	x
	RTH-DxxQA-ND0					
	EAS	A0_h	When EAS bit is "1", reply response code 6 times	x	x	x
	Write EAS	A1_h	Write EAS data (1 bit). Data "1" validates anti-theft/goods-monitoring. Data "0" invalidates them	x	x	x
	Read Multiple Blocks Unlimited	A5_h	Read the specified data of up to 256 blocks in the user/system memory at once	x	x	x
	Fast Inventory	B1_h	Fast response Inventory command	x	x	x
	Fast Read Single Block	C0_h	Fast response Read Single Block command	x	x	x
	Fast Write Single Block	C1_h	Fast response Write Single Block command	x	x	x
Fast Read Multiple Blocks	C3_h	Fast response Read Multiple Blocks command	x	x	x	
Fast Write Multiple Blocks	C4_h	Fast response Write Multiple Blocks command	x	x	x	
Fast Write EAS	D1_h	Fast response Write EAS command	x	x	x	
Fast Read Multiple Blocks Unlimited	D5_h	Fast response Read Multiple Blocks Unlimited command	x	x	x	

NOTES ON USING MB89R118C

Parameter	ISO/IEC 15693 Specification	MB89R118C
Data coding	1 out of 256	No correspondence
Subcarrier	2-subcarrier	No correspondence
Optional command	Read Multiple Blocks command	Correspondence up to 2 blocks
	Write Multiple Blocks command	Correspondence up to 2 blocks

The above table presents the discrepancies between the IC MB89R118C and the ISO/IEC 15693 standard.

NOTES ON USING I-CODE SLI-X2 – 16-bit counter features

Block 79 of the user memory contains the 16-bit counter. The block can be accessed with the standard READ and WRITE commands but special data considerations are required. The standard password protection mechanisms for the user memory is not valid for block 79.

The 16 bit counter (block 79) can be

- read
- increased by one

The counter can be read with a READ SINGLE BLOCK command to block 79 or a READ MULTIPLE BLOCK command including block 79. The 4 byte data from block 79 provide the following information:

Counter block data structure

Byte	Name	Value	Description
0	C0	0x00 – 0xFF	LSB of the counter value
1	C1	0x00 – 0xFF	MSB of the counter value
2	–	0x00	RFU
3	–	0x00	RFU

To increment the counter, a WRITE SINGLE BLOCK command must be sent to block 79 with the following values: **C0=0x01** and **C1=0x00**.
