In This Chapter...

- H2–SERIO(-4) Overview ................................ 3–2
- Specifications ........................................ 3–3
- H2-SERIO-4 Wiring: RS-422/485 ......................... 3–4
- Using Think & Do to Set Serial Port Parameters  .............. 3–5

Note: This Chapter only applies if you are using the WinPLC with Think & Do Studio version 6.0 or later, including Think & Do 8.0.
Use Appendix B if using the WinPLC with Think & Do versions 5.2 or 5.3.
Only Think & Do WinPLCs (H2-WPLC1-TD and H2-WPLC2-TD) support the H2–SERIO module.
H2–SERIO(-4) Overview

The Scope of This Chapter

This chapter introduces the use of the H2-SERIO and H2-SERIO-4 modules using the WinPLC with Think & Do, version 6.0 or later). See Appendix B if you are using Think & Do versions 5.2 or 5.3.

This chapter will not describe in detail how to build a project or connect to a WinPLC. Depending on which version of Think & Do you are using, further information can be found in:

Chapter 2 of this manual, Workbench Utility Operation

Appendix A of this manual, Using The ESP Utility To Set Up The WinPLC

The Think & Do Learning Guide or QuickStart Guide.

The basic steps in using this module are:

1. Install the Serial I/O module in the base.
2. Connect power to the base.
3. Bring up Think & Do.
4. Select the WinPLC as the target.
5. Connect to the WinPLC.

Add Serial Ports to Your WinPLC or EBC(100)

The H2-SERIO and H2-SERIO-4 modules plug into the DL205 I/O base and are 3 port serial I/O modules for use with the H2-WPLC-x (WinPLC) and the H2-EBC/H2-EBC100. These additional serial ports give the H2-WPLC-x and H2-EBC(100) the ability to connect with a wide range of serial devices, such as barcode scanners, scales, printers and modems.

The H2-SERIO module has three RS-232C ports, while the H2-SERIO-4 module has two RS-232C ports and one RS-422/485 port.

A WinPLC can support up to three H2-SERIO(-4) modules for a total of ten serial ports (including the one on the WinPLC itself). Port numbers are assigned from left to right across the base. For example, on a WinPLC the onboard port is Com 1:

• The first H2-SERIO(-4) module would have ports Com 2, Com 3 and Com 4.
• The next H2-SERIO(-4) module would have Com 5, Com 6 and Com 7.
• The final H2-SERIO(-4) module would have Com 8, Com 9 and Com 0.

An H2-EBC100 can support up to eight H2-SERIO(-4) modules; the limits are the power budget and number of slots in the base.

The H2-SERIO(-4) modules can reside in any slot of the DL205 base; they do not have to be installed next to each other.
Setting Communication Parameters Using Think & Do

Use I/O View to set baud rate, parity, data bits, and stop bits for each port. Choose from 1200 to 115,200 baud communication speeds. Think & Do allows each port to be designated as a MODBUS slave or a generic serial device. Each port on the H2–SERIO(-4) module is capable of hardware handshaking.

**NOTE:** The serial port on-board the WinPLC has a different pinout from the H2–SERIO module. Refer to page 1–7 for the WinPLC serial port pin assignments.

H2-SERIO-4 Wiring: RS-422/485

Set DIP switch S2 on the H2-SERIO-4 to:
1. Activate or deactivate the internal 120Ω termination resistor.
2. Select RS-422 or RS-485 operation.

**RS-422**

(H2-SERIO-4 contains an optional 120Ω termination resistor between RX+ and RX-; use DIP switch S2 to activate or deactivate resistor.)

**RS-485**

(H2-SERIO-4 contains an optional 120Ω termination resistor between RX+ and RX-; use DIP switch S2 to activate or deactivate resistor.)

* User Supplied 120Ω Termination Resistor
Using Think & Do to Set Serial Port Parameters

Installing the H2-SERIO(-4)

Install the WinPLC and the H2–SERIO(-4) module in your DL205 base. Please refer to the guidelines elsewhere in this publication for information about installation, power wiring, and Ethernet connections. The WinPLC must be recognized on the network to proceed, so use Think & Do to establish your link to the WinPLC.

Setting the WinPLC as the Runtime Target

With Think & Do ProjectCenter open, click the “Project Explorer Bar”, and project information will display in the main ProjectCenter window. In the “Runtime Target” area, select “Windows CE - Think & Do WinPLC” from the drop-down list.
Using Think & Do ConnectivityCenter to Set Up The Serial I/O Module

ConnectivityCenter is the Think & Do tool for configuring I/O devices. See the Think & Do Studio Learning Guide (Chapter 2) for more detailed information on using ConnectivityCenter.

Open up the ConnectivityCenter.

Adding the Serial I/O Module Driver

Again, see the Think & Do Learning Guide or QuickStart Guide for more information on adding I/O drivers.

Either click on the “Drivers” menu and select “Add”, or click on the Add Driver toolbar button.

Select “Think & Do WinPLC Backplane I/O” as the target.
Connecting To The WinPLC

To connect to the WinPLC, click “Configuration”, and select “Connect”.

Think & Do recognizes the DL205 base as you have configured it. The WinPLC is displayed in the CPU slot, and the Serial I/O module is displayed where you have installed it.

Click on “Serial Driver”.

You will see a port configuration box for each serial port Think & Do recognizes. In our example to the right, Think & Do sees four serial ports. One is on the WinPLC and the other three are on the Serial I/O module.

Notice that the ports are numbered COM 1 through COM 4 in Think & Do. COM 1 is on the WinPLC. COM 2 through COM 4 are on the first Serial I/O module in the base. Think & Do counts the serial ports from top to bottom (on the Serial I/O module) and from left to right in terms of slot position.

If you install additional Serial I/O modules at a later time, be aware that the order of the modules in the base determines their COM numbers. If you install a Serial I/O module between an existing Serial I/O module and the CPU, your port settings will remain the same, but the COM number will change.
Setting Serial Port Parameters

To set the serial port parameters, click on the “Serial Driver” in the left pane of the ConnectivityCenter window. You will see a port configuration box for each serial port Think & Do recognizes. In our example to the right, Think & Do sees four serial ports. One is on the WinPLC and the other three are on the Serial I/O module.

Expand the Window Pane

Position your cursor on the line that separates the upper window panes from the lower window pane. Move this line up by dragging your mouse. Click on the tab at the bottom of the lower window pane marked “Module Info.” You will see a screen that looks similar to the one shown here. Pull-down menus allow you to change the serial port parameters.

Select the port whose parameters you want to change by clicking on that port in the upper right pane. Make the changes in the lower pane, and save the changes using the Ctrl + S keys.
