#### 1. Safety instructions

- Switch main power off before connecting or disconnecting the device. Risk of explosion!
- If the unit is used in a manner not specified by the manufacturer, the protection provided by the equipment
  may be impaired.
- To guarantee sufficient convection cooling, please refer to the following instructions to ensure sufficient clearance around the device.

Vertical Mounting: 80 mm [3.15 in] above and 40 mm [1.57 in] below the device as well as a lateral distance of 5 mm [0.20 in] to other units. In case the adjacent device is a heat source (50% load of 120W), the lateral distance will be 25 mm [0.98 in].

Horizontal Mounting: 80 mm [3.15 in] above and 40 mm [1.57 in] below the device as well as a lateral distance of 40 mm [1.57 in] to other units.

- The external enclosure where the unit will be installed shall meet the requirements for mechanical, electrical and fire enclosure.
- Note that the enclosure of the device can become very hot depending on the ambient temperature and load of the power supply. Risk of burns!

# CAUTION: Hot surface

- The main power must be turned off before connecting or disconnecting wires to the terminals!
- Do not introduce any objects into the unit!
- Dangerous voltage present for at least 5 minutes after disconnecting all sources of power.
- The power supplies are built in units and must be installed in a cabinet or room (condensation free environment and indoor location) that is relatively free of conductive contaminants.
- The power supply is approved for the connection to 3-phase TN, TT and IT power grids (star networks) with a
  phase-to-phase voltage of 480 VAC (max. 500 VAC).
- CAUTION: "For use in a controlled environment".

# 2. Device description (Fig. 1)

- (1) Input terminal block connector
- (4) DC voltage adjustment potentiometer
- (2) Output terminal block connector
- (5) DC OK LED (green)

(3) DC OK relay contact

- (6) 35mm DIN rail mounting (DIN rail sold separately)
- 3. Mounting and dismounting (Fig. 2, Fig. 3)

The power supply unit can be mounted on 35 mm DIN rails in accordance with EN 60715. For Vertical Mounting, the device should be installed with input terminal block on the bottom. For Horizontal Mounting, the device should be installed with input terminal block on the left side.

Each device is delivered ready to install

- 1. Tilt the unit slightly upwards and put it onto the DIN rail. Snap on the DIN rail as shown in Fig. 2.
- 2. Push downwards until stopped.
- 3. Press against the bottom front side for locking.
- 4. Shake the unit slightly to ensure that it is secured.
- 5. To uninstall, pull or slide down the latch as shown in Fig. 3. Then, slide the PSU in the opposite direction, release the latch and pull out the PSU from the rail.

#### 4. Connection

The terminal block connectors allow easy and fast wiring.

You can use flexible (stranded wire) or solid cables with the following cross sections:

Table 1 Refer to Fig. 1:	Standard / Solid		Torque		Stripping Length	
	(mm²)	(AWG)	(Nm)	(lb in)	(mm)	(in)
(1), (2)	0.82-5.3	18-10	0.54	4.7	8	0.31
(3)	0.52-1.3	20-16	-	-	8	0.31

Please ensure that the wires are fully inserted into the connecting terminals as shown in Fig. 5. In accordance to IEC/EN/UL 62368-1 and IEC/EN/UL 61010-2-201, flexible cables require ferrules.

Use appropriate copper wire that is designed to sustain operating temperature of:

- 1. At least 75°C (167°F) for < 40°C (104°F).
- 2. At least 90°C (194°F) for < 70°C (158°F).

#### 4.1. Input connection (Fig. 1, Fig. 6)

Use L1, L2, L3 and PE connections of input terminal connector (see Fig. 1 (1)) to establish the  $3\times380-500\ VAC$  connection. Fig. 6 shows the connection to the various network types.

In the event of a phase failure, unrestricted operation is possible with nominal capacity.

The unit is protected with internal fuse (not replaceable) at L1, L2 and L3 pins, which have been tested and approved on 20A (UL) and 16A (IEC) branch circuits without additional protection device. An external protection device is only required if the supplying branch has an ampacity greater than above. Thus, if an external protective device is necessary, or, utilized, a minimum value of 4A B- or C- should be used.

The internal fuse must not be replaced by the user.

#### 4.2. Output Connection (Fig. 1 (2))

Use the "+" and "-" screw connections to establish the 24 VDC connection. The output provides 24 VDC. The output voltage can be adjusted from 24 to 28 VDC on the potentiometer. The green LED DC OK displays correct function of the output (Fig. 1 (5)). The device has a short circuit and overload protection and an overvoltage protection limited to < 35 VDC.

#### 4.3. Output characteristic curv

The device functions normal under operating line and load conditions. In the event of an over load ( $I_0 = 105-150\%$ ) the output voltage will start to droop and bounce until over load has been removed. If the loads are in short circuit, the secondary voltage will bounce and recover once the short circuit has been removed.

# 4.4. Indicators and relay contacts (Fig. 4)

## 4.5. Thermal behavior (Fig. 7)

If the output capacity is beyond what is recommended in Fig. 7, the device will run into thermal protection by switching off i.e. device will go in bouncing mode and will recover when ambient temperature is lowered or load is reduced as far as necessary to keep device in working condition.
