1 Notes about this Documentation

Note

Always retain this documentation!

This documentation is part of the product. Therefore, retain the documentation during the entire service life of the product. Pass on the documentation to any subsequent user. In addition, ensure that any supplement to this documentation is included, if necessary.

1.1 Validity of this Documentation

This documentation is only applicable to WAGO ETHERNET accessory products “Lean Managed Switch” (852-1813/000-001).

1.2 Copyright

This Manual, including all figures and illustrations, is copyright-protected. Any further use of this Manual by third parties that violate pertinent copyright provisions is prohibited. Reproduction, translation, electronic and phototechnical filing/archiving (e.g., photocopying) as well as any amendments require the written consent of WAGO Kontakttechnik GmbH & Co. KG, Minden, Germany. Non-observance will involve the right to assert damage claims.

1.3 Symbols

DANGER

Personal Injury!

Indicates a high-risk, imminently hazardous situation which, if not avoided, will result in death or serious injury.

DANGER

Personal Injury Caused by Electric Current!

Indicates a high-risk, imminently hazardous situation which, if not avoided, will result in death or serious injury.

WARNING

Personal Injury!

Indicates a moderate-risk, potentially hazardous situation which, if not avoided, could result in death or serious injury.

CAUTION

Personal Injury!

Indicates a low-risk, potentially hazardous situation which, if not avoided, may result in minor or moderate injury.

NOTICE

Damage to Property!

Indicates a potentially hazardous situation which, if not avoided, may result in damage to property.

NOTICE

Damage to Property Caused by Electrostatic Discharge (ESD)!

Indicates a potentially hazardous situation which, if not avoided, may result in damage to property.

Note

Important Note!

Indicates a potential malfunction which, if not avoided, however, will not result in damage to property.

Information

Additional Information:

Refers to additional information which is not an integral part of this documentation (e.g., the Internet).

1.4 Number Notation

Table 1: Number Notation

Number Code	Example	Note
Decimal	100	Normal notation
Hexadecimal	0x64	C notation
Binary	'100' '0110.0100'	In quotation marks, nibble separated with dots (.)

1.5 Font Conventions

Table 2: Font Conventions

Font Type	Indicates
<i>italic</i>	Names of paths and data files are marked in italic-type. e.g.: <i>C:\Program Files\WAGO Software</i>
Menu	Menu items are marked in bold letters. e.g.: Save
>	A greater-than sign between two names means the selection of a menu item from a menu. e.g.: File > New
Input	Designation of input or optional fields are marked in bold letters, e.g.: Start of measurement range
"Value"	Input or selective values are marked in inverted commas. e.g.: Enter the value "4 mA" under Start of measurement range .
[Button]	Pushbuttons in dialog boxes are marked with bold letters in square brackets. e.g.: [Input]
[Key]	Keys are marked with bold letters in square brackets. e.g.: [F5]

2 Important Notes

This section includes an overall summary of the most important safety requirements and notes that are mentioned in each individual section. To protect your health and prevent damage to devices as well, it is imperative to read and carefully follow the safety guidelines.

2.1 Legal Bases

2.1.1 Subject to Changes

WAGO Kontakttechnik GmbH & Co. KG reserves the right to provide for any alterations or modifications. WAGO Kontakttechnik GmbH & Co. KG owns all rights arising from the granting of patents or from the legal protection of utility patents. Third-party products are always mentioned without any reference to patent rights. Thus, the existence of such rights cannot be excluded.

2.1.2 Personnel Qualification

All sequences implemented on Series 852 devices may only be carried out by electrical specialists with sufficient knowledge in automation. The specialists must be familiar with the current norms and guidelines for the devices and automated environments.

All changes to the controller should always be carried out by qualified personnel with sufficient sufficient skills in PLC programming.

2.1.3 Proper Use of the Industrial Switches

The device is designed for the IP30 protection class. It is protected against the insertion of solid items and solid impurities up to 2.5 mm in diameter, but not against water penetration. Unless otherwise specified, the device must not be operated in wet and dusty environments.

2.1.4 Technical Condition of Specified Devices

The devices to be supplied ex works are equipped with hardware and software configurations, which meet the individual application requirements. These modules contain no parts that can be serviced or repaired by the user. The following actions will result in the exclusion of liability on the part of WAGO Kontakttechnik GmbH & Co. KG:

- Repairs,
- Changes to the hardware or software that are not described in the operating instructions,
- Improper use of the components.

Further details are given in the contractual agreements. Please send your request for modified and new hardware or software configurations directly to WAGO Kontakttechnik GmbH & Co. KG.

2.1.5 Standards and Regulations for Operating the Industrial Switches

Please observe the standards and regulations that are relevant to installation:

- The data and power lines must be connected and installed in compliance with the standards to avoid failures on your installation and eliminate any danger to personnel.
- For installation, startup, maintenance and repair, please observe the accident prevention regulations of your machine (e.g., DGUV Regulation "Electrical Installations and Equipment").
- Emergency stop functions and equipment must not be deactivated or otherwise made ineffective. See relevant standards (e.g., EN 418).
- Your installation must be equipped in accordance to the EMC guidelines so electromagnetic interferences can be eliminated.
- Please observe the safety measures against electrostatic discharge according to EN 61340-5-1/-3. When handling the modules, ensure that environmental factors (persons, workplace and packing) are well grounded.
- The relevant valid and applicable standards and guidelines regarding the installation of switch cabinets must be observed.

2.2 Safety Advice (Precautions)

For installing and operating purposes of the relevant device to your system the following safety precautions shall be observed:

DANGER

Do not work on devices while energized!

All power sources to the device shall be switched off prior to performing any installation, repair or maintenance work.

DANGER

Only install in appropriate housings, cabinets or electrical operation rooms!

WAGO's 852 Series ETHERNET Switches are considered exposed operating components. Therefore, only install these switches in lockable housings, cabinets or electrical operation rooms. Access must be limited to authorized, qualified staff having the appropriate key or tool.

DANGER

Ensure a standard connection!

To minimize any hazardous situations resulting in personal injury or to avoid failures in your system, the data and power supply lines shall be installed according to standards, with careful attention given to ensuring the correct terminal assignment. Always adhere to the EMC directives applicable to your application.

NOTICE

Do not use in telecommunication circuits!

Only use devices equipped with ETHERNET or RJ-45 connectors in LANs. Never connect these devices with telecommunication networks.

NOTICE

Replace defective or damaged devices!

Replace defective or damaged device/module (e.g., in the event of deformed contacts).

NOTICE

Protect the components against materials having seeping and insulating properties!

The components are not resistant to materials having seeping and insulating properties such as: aerosols, silicones and triglycerides (found in some hand creams). If you cannot exclude that such materials will appear in the component environment, then install the components in an enclosure being resistant to the above-mentioned materials. Clean tools and materials are imperative for handling devices/modules.

NOTICE

Clean only with permitted materials!

Clean housing and soiled contacts with propanol.

NOTICE

Do not use any contact spray!

Do not use any contact spray. The spray may impair contact area functionality in connection with contamination.

NOTICE

Do not reverse the polarity of connection lines!

Avoid reverse polarity of data and power supply lines, as this may damage the devices involved.

NOTICE

Avoid electrostatic discharge!

The devices are equipped with electronic components that may be destroyed by electrostatic discharge when touched. Please observe the safety precautions against electrostatic discharge per DIN EN 61340-5-1/-3. When handling the devices, please ensure that environmental factors (personnel, work space and packaging) are properly grounded.

CAUTION

Laser radiation warning!

Do not stare into openings of the connections when no cable is connected, so as not to expose the radiation.

It can emit invisible radiation.

It concerns here a laser class 1 according EN 60825-1.

Note

Radio interference in residential areas

This is a Class A device. This device can cause radio interference in residential areas; in this case, the operator can be required to take appropriate measures to prevent such interference.

2.3 Special Use Conditions for ETHERNET Devices

If not otherwise specified, ETHERNET devices are intended for use on local networks. Please note the following when using ETHERNET devices in your system:

- Do not connect control components and control networks directly to an open network such as the Internet or an office network. WAGO recommends putting control components and control networks behind a firewall.
- Limit physical and electronic access to all automation components to authorized personnel only.
- Change the default passwords before first use! This will reduce the risk of unauthorized access to your system.
- Regularly change the passwords used! This will reduce the risk of unauthorized access to your system.
- If remote access to control components and control networks is required, use a Virtual Private Network (VPN).
- Regularly perform threat analyses. You can check whether the measures taken meet your security requirements.
- Use “defense-in-depth” mechanisms in your system's security configuration to restrict the access to and control of individual products and networks.

3 General

3.1 Scope of Supply

- 1 Industrial Lean Managed Switch with CAGE CLAMP® connection (Item. No. 2231-106/026-000)
- Protective covers for unused ports
- Operating and Assembly instructions

3.2 Industrial ETHERNET Technology

WAGO's rugged Lean Managed Switches are designed for industrial use in compliance with the following standards:

- IEEE 802.3 10BASE-T
- IEEE 802.3u 100BASE-TX/FX
- IEEE 802.3ab 1000BASE-T Ethernet
- IEEE 802.3z 1000BASE-SX/LX/ZX
- IEEE 802.3x Flow Control
- IEEE 802.1d Spanning Tree Protocol (STP)
- IEEE 802.1w Rapid Spanning Tree Protocol (RSTP)
- IEEE 802.1Q VLAN Tagging
- IEEE 802.1p Prioritization
- IEEE 802.1x Port Authentication
- IEEE 802.1ab Link Layer Discovery Protocol (LLDP)
- IEEE 802.1AB LLDP-MED
- IEEE 802.3af Power over Ethernet (PoE)
- IEEE 802.3at High Power over Ethernet (PoE+)
- IEEE 802.3az Energy Efficient Ethernet (EEE)
- ITU-T G8032v1/v2 Ethernet Ring Protection Switching (ERPS)

The switches have a power supply with a supply voltage range of 24 ... 57 V.

“Power over Ethernet” (PoE+) is supported on eight ports. Features such as autonegotiation and auto MDI/MDIX (crossover) on all 10/100/1000 BASE-T ports are also implemented.

3.3 Switching Technology

Industrial ETHERNET primarily uses switching technology. This technology allows any network subscriber to send at any time because the subscriber always has an open peer-to-peer connection to the next switch. The connection is bidirectional, i.e., the subscriber can send and receive at the same time (full duplex).

The targeted use of switching technology can increase real-time capability because the peer-to-peer connection prevents collisions in network communication.

3.4 PoE (Power over Ethernet)

“Power over Ethernet” (PoE) supplies power and transmits data simultaneously and safely over the same ETHERNET cable, eliminating the need for a separate power supply.

“Power over Ethernet” (PoE) is an ETHERNET network technology defined in the IEEE 802.3af (PoE) und 802.3at (PoE+) standards.

If the IEEE 802.3at standard is supported, a higher current can be transmitted via the ETHERNET cable.

3.5 Autonegotiation

Autonegotiation allows the switch to detect the transmission rate and operating mode for each port and the connected subscriber or subscribers, and to set them automatically. The highest possible mode (transmission speed and operating mode) is set.

Autonegotiation is available to ETHERNET subscribers connected to the switch via copper cable.

This make the switch a plug-and-play device.

3.6 Autocrossing

Autocrossing (MDI/MDI-X, “Medium Dependent Interface”) automatically reconfigures the receive and transmit signals for twisted-pair interfaces as needed. This allow users to use wired and crossover cables in the same manner 1:1.

3.7 Store-and-forward switching mode

In “Store and Forward” mode, the ETHERNET switch caches the entire data telegram, checks it for errors (CRC checksum) and if there are no errors, puts it in a queue. Subsequently, the data telegram (MAC table) is selectively forwarded to the port that has access to the addressed node.

The time delay required by the data telegram to pass the store-and-forward switch depends on the telegram length.

Advantage of “Store and Forward”:

The data telegrams are checked for correctness and validity. This prevents faulty or damaged data telegrams from being distributed via the network.

3.8 Transmission Methods

2 modes are available for data transmission in ETHERNET networks:

- Half duplex
 - An ETHERNET device can only send or receive data at one time.
 - Collision detection (CSMA/CD) is enabled.
 - The length of the network is limited by the propagation delays of the devices and transmission media.
- Full duplex
 - An ETHERNET device can send and receive data at the same time.
 - Collision detection (CSMA/CD) is disabled.
 - The length of the network only depends on the performance limits of the send and receive components used.

4 Device Description

The 852-1813/000-001 is a configurable industrial ETHERNET switch with eight 10/100/1000BASE-T ports, all of which support 30 W “Power over Ethernet” (PoE+), and two 100BASE-FX/1000BASE-LX/SX/ZX SFP ports (SFP modules are available as an option).

All eight PoE+ ports can be operated simultaneously (PoE power budget: 24 VDC = 120 W or 48 VDC = 240 W).

Enclosed in a rugged housing, this switch offers both a redundant power supply and relay-based function monitoring. This device also streamlines network management: Commissioning and diagnostics are intuitive and can be performed without extensive IT knowledge.

The topology map clearly displays the switch and connected devices. Key diagnostic information is displayed on the diagnostics dashboard.

The following functions increase the robustness, availability and security of the network:

Security:

- Network segmentation per IEEE802.1Q (max. 5 VLANs),
- authentication of network participants per IEEE802.1X,
- firewall functions using access-control list (max. 32 entries)
- service control,
- port security

Availability:

- Rapid Spanning Tree Protocol (RSTP) for meshed and ring networks,
- ETHERNET Ring Protection Switching (ERPS) for up to two rings per switch,
- loop detection and
- storm control on each port

Configuration/Diagnostics/Maintenance:

- Port mirroring,
- Modbus® registers,
- SNMP v3,
- SNMP trap events,
- alarm threshold,
- port statistics,
- backup and restore,
- system log,
- syslog server,
- command line interface with SSH/Telnet,
- topology map and
- dashboard

4.1 View

4.1.1 Front View

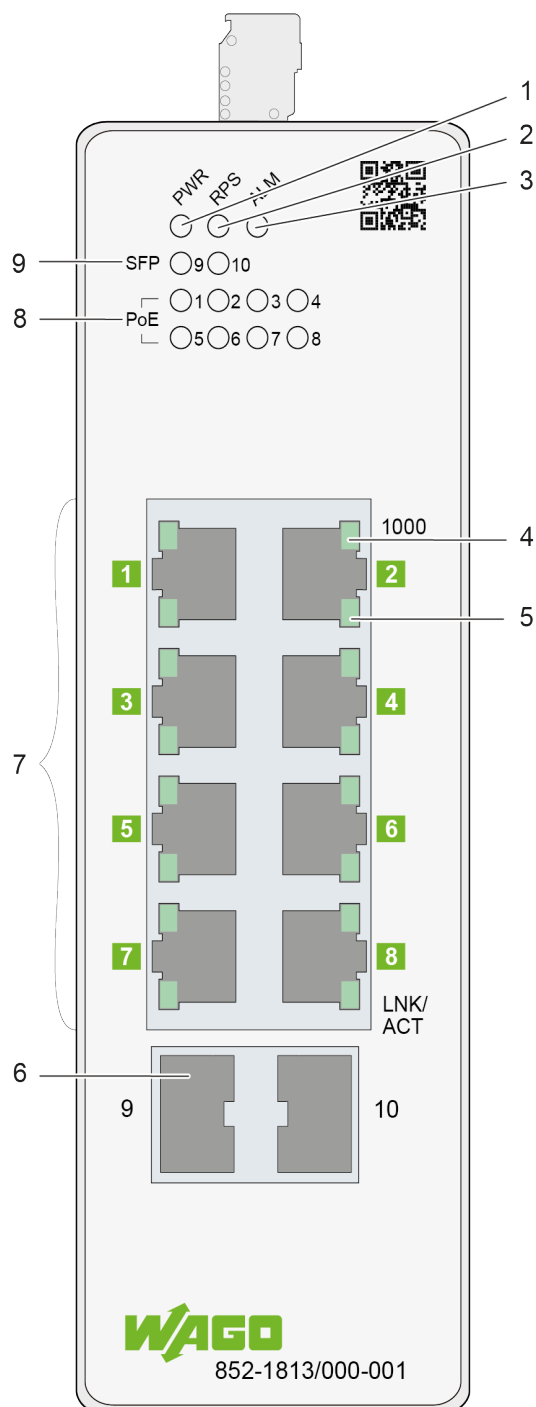

Figure 1: Front View of the Lean Managed Switch

Pos.	Description	Meaning	For Details, see Section
1	PWR	Status LED, supply voltage	“Device Description” > “Display Elements”
2	RPS	Status LED, redundant supply voltage	“Device Description” > “Display Elements”
3	ALM	Status LED, alarm	“Device Description” > “Display Elements”
4	-	Status LED TX port 1000 Mbit/s (1 LED for each port)	“Device Description” > “Display Elements”
5	-	Status LED TX port LNK/ACT (1 LED for each port)	“Device Description” > “Display Elements”
6	-	Port SFP Slot (1000BASE-SX/-LX/-ZX or 100BASE-FX, fiber optic) (2)	“Device Description” > “Connections”
7	-	Port RJ-45 (10/100M/1000BASE-T + PoE) (8)	“Device Description” > “Connections”
8	PoE	Status LED PoE (1 LED for each port)	“Device Description” > “Display Elements”
9	SFP	Status LED SFP (1 LED for each port)	“Device Description” > “Display Elements”

4.1.2 Top View

Figure 2: Top View of the Lean Managed Switch

Table 4: Legend for the Figure "Top View of the Lean Managed Switch"

No.	Descrip- tion	Meaning	For Details see Section
1	-	Grounding screw	-
2	Reset	Reset button	"Device Description" > "Operating Elements"
3	-	Connector (male) for power consumption (PWR/RPS/ALM) and potential-free alarm contact	"Device Description" > "Connections"
4	-	DIP Switches	"Device Description" > "Operating Elements"

4.2 Connectors

4.2.1 Grounding screw

The switch must be grounded.

Connect the grounding screw to the ground potential.

Do not operate the switch without an appropriately installed protective earth conductor.

Figure 3: Grounding screw

4.2.2 Power Supply (PWR/RPS)

The female connector (Item No. 2231-106/026-000) can easily be connected to the 6-pole male connector located on the top of the switch.

The male connector shows the following pin assignment:

Figure 4: Power Supply (PWR/RPS)

Table 5: Legend for Figure "Power Supply (PWR/RPS)"

Connection	Description	Description
+	PWR	Primary DC input
-	PWR	Primary DC input
+	RPS	Secondary DC input
-	RPS	Secondary DC input
	ALM	Contact for external alarm
	ALM	Contact for external alarm

NOTICE

Warning: Damage to property caused by electrostatic discharge (ESD)!

DC Powered Switch: Power is supplied through an external DC power source. Since the switch does not include a power switch, plugging its power adapter into a power outlet will immediately power it on.

4.2.3 Network Connections

The Lean Managed Switch uses ports with fiber optic or copper connectors and supports ETHERNET, Fast ETHERNET and Gigabit Ethernet.

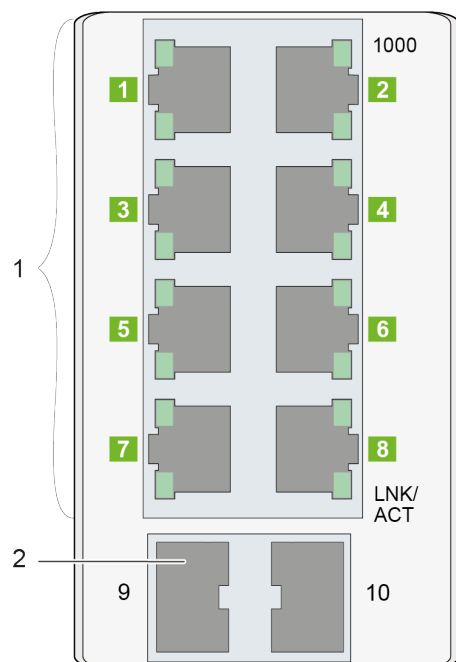

Figure 5: Network Connections

Table 6: Legend for Figure “Network Connections”

No.	Designation	Meaning	For Details, see Section:
1	-	RJ-45 connections (10/100/1000BASE-T) with PoE+ (8)	“Device Description” > ... “10/100/1000BASE-T Ports with PoE+”
2	-	SFP slots (1000BASE-SX/LX/ZX or 100BASE-FX, glass fiber) (2)	“Device Description” > ... “1000BASE-SX/LX/ZX or 100BASE-FX Ports”

4.2.3.1 RJ45 Connection

The connection to ETHERNET-based fieldbuses is made via the RJ-45 connector. The pin assignment for ETHERNET RJ-45 plugs is specified in the EIA/TIA 568 standard. The conductor colors also correspond to this standard. The pin assignment and conductor color differ depending on the number of assigned conductors (4- or 8-core).

4.2.3.2 10/100/1000BASE-T-Ports

The 10/100/1000BASE-T ports support network speeds of 10 Mbit/s, 100 Mbit/s and 1000 Mbit/s and can be operated in half- and full-duplex transmission modes. These ports also provide automatic crossover detection (Auto-MDI/MDI-X), with plug-and-play capabilities. Simply plug the network cables into the ports; they then adapt to the end node devices. We recommend the following cable for the RJ-45 ports:

- Cat. 5e or better with a max. cable length 100 m

4.2.3.3 10/100/1000BASE-T-Ports with PoE+

10/100/1000BASE-T ports support Power over Ethernet + (PoE+) up to 30 W per port.

Advantages:

- No separate power supply required for PoE+-capable terminal devices
- No separate data and power lines required

Note

Observe the PoE budget

The PoE budget for $\geq 24 \dots < 48$ VDC is 120 W.

The PoE budget for $\geq 48 \dots 57$ VDC is 240 W.

4.2.3.4 1000BASE-SX/-LX/-ZX or 100BASE-FX Ports

The 1000BASE-SX/-LX/-ZX ports are designed to connect the gigabit SFP modules.

Additionally the connection of 100BASE-FX with a network speed of 100 Mbit/s is possible.

The selection of the speed at the SFP slots is done via the DIP switches. (see section "Operating Elements" > "DIP Switches").

4.3 Display Elements

The Lean Managed Switch is equipped with device LEDs and port LEDs. You can see the status quickly with the device LEDs, while the port LEDs provide information about connection actions.

4.3.1 Device LEDs

Figure 6: Device LEDs

Table 7: Legend for "Device LEDs" Figure

LED	Name	Status	Description
PWR	Primary Power LED	Green	Use the primary power supply
		Off	Primary power off or failure
RPS	Redundant Power System LED	Green	Use the redundant power supply
		Off	Redundant power off or failure
ALM	Alarm LED	Red	Failure of a port connection; miscellaneous alarm
		Off	No alarm to report
SFP	9, 10 SFP Port LED	Green	SFP slot in operation
		Flashes	Data traffic via connection
		Off	Port disconnected or link failed
PoE	1 ... 8 PoE Port LED	Green	Power feeding on PoE port
		Off	No power is feeding

4.3.2 Port LEDs

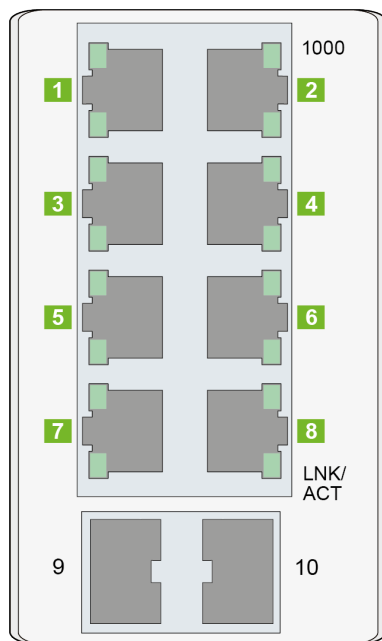

Figure 7: Port LEDs

Table 8: Legend for "Port LEDs" Figure

LED	Name	Status	Description
1000	1000BASE T-Ports LED (1 LED for each port)	Green	1000 Mbit/s connection in operation
		Off	Port disconnected or link failed
LNK/ACT	10/100BASE T-Ports LED (1 LED for each port)	Green	10/100/1000 Mbit/s connection in operation
		Flashes	Data traffic via connection
		Off	Port disconnected or link failed

4.4 Operating Elements

4.4.1 DIP Switches

There are two DIP switches for alarm configuration on the top of the Lean Managed Switch. When the alarm reporting function is active, the alarm contact is switched when an alarm event occurs.

The meaning of the DIP switch settings are described below:

Figure 8: DIP Switches

Table 9: Legend for Figure "DIP Switches"

No.	Name	Status	Description
1	PWR	ON	The alarm reporting function for the primary power supply is activated.
		OFF	The alarm reporting function for the primary power supply is deactivated.
2	RPS	ON	The alarm reporting function for the secondary power supply is activated.
		OFF	The alarm reporting function for the secondary power supply is deactivated.
3	Storm	ON	Storm Control is activated (300 packets per second, broadcast/DLF).
		OFF	Storm control is controlled through software.
4	QoS	ON	Port based QoS on Port 1 ... 2.
		OFF	Quality of Service is controlled through software.
5	P9 100FX	ON	100 Mbit/s connection in operation
		OFF	1000 Mbit/s connection in operation
6	P10 100FX	ON	100 Mbit/s connection in operation
		OFF	1000 Mbit/s connection in operation

The user can manually switch the alarm function for the primary or redundant power supply on and off through the DIP switches.

The DIP switch must be “ON” to activate the port alarm function. The default setting is “OFF”.

The following is the recommended procedure for configuring and setting DIP switches during initial installation:

- 1 Turn all DIP switches to “OFF”.
- 2 Install the Lean Managed Switch in your network.
- 3 Select the port(s) to be monitored or the alarm to be activated.
- 4 Set the DIP switch of the corresponding port to “ON”.
- 5 Turn the Lean Managed Switch ON.

4.4.2 Reset Button

Figure 9: Reset Button

Table 10: Legend for Figure “Reset Button”

Name	Status	Description
Reset	Press the Reset button for 2 seconds and release.	The system is restarted.
Delivery state	Press the Reset button for 10 seconds and release.	The system is reset to the switches factory default settings.

Note

Use a suitable object

Use a suitable object, e.g., ballpoint pen or straightened paper clip, to press the Reset button.

4.5 Label

4.5.1 Hardware and Software Version

There is a label with the “MAC Address” and “Serial NO” on the back of the Lean Managed Switch.

Figure 10: Label

Table 11: Legend for Figure “Label”

No.	“Serial NO” Description
01	Firmware version (left number sequence)
01	Hardware version (right number sequence)

4.6 Technical Data

4.6.1 Device Data

Table 12: Technical Data – Device Data

Width	50 mm
Height	120 mm (from the top edge of the carrier rail)
Depth	160 mm
Weight	560 g
Degree of protection	IP30

4.6.2 System Data

Table 13: Technical Data – System Data

MAC table	Up to 8000 addresses
VLAN	Port based and tag based (max. 5 VLANs)
Jumbo Frame Size	10 kB
Wavelength optical fibers	Depends on SFP module
Maximum lengths	10/100/ 1000BASE-TX: 100 m; Fiber optic: Depends on SFP module

4.6.3 Power Supply

Table 14: Technical Data – Power Supply

Supply voltage	24 ... 57 VDC
Power consumption, max.	13 W; 253 W with 8 PoE+; 30 W je port

4.6.4 Power over Ethernet (PoE)

Table 15: Technical Data – Power over Ethernet (PoE)

Power available at PD	25.50 W
Max. Power delivered by PSE	30 W
Voltage Range (at PD ¹⁾)	50 ... 57 V
Voltage Range (at PSE ²⁾)	24 ... 57 V
Max. Current	600 mA
Max. Cable resistance	12.5 Ω (Category 5)
PoE Power -Budget	120 W when supply voltage is $\geq 24 \dots < 48$ VDC 240 W when supply voltage is $\geq 48 \dots 57$ VDC
PoE supported mode	Mode A

¹⁾ PD = „Powered Device“

²⁾ PSE = „Power Sourcing Equipment“

4.6.5 Communication

Table 16: Technical Data – Communication

Ports (copper; RJ-45)	8 x 10/100/1000BASE-T with PoE+
Ports (LWL)	2 x 1000BASE-SX/-LX/-ZX or 100BASE-FX (SFP-Slot)
Standards	IEEE 802.3 10BASE-T IEEE 802.3u 100BASE-TX/FX IEEE 802.3ab 1000BASE-T Ethernet IEEE 802.3z 1000BASE-SX/LX/ZX IEEE 802.3x Flow Control IEEE 802.1d Spanning Tree Protocol (STP) IEEE 802.1w Rapid Spanning Tree Protocol (RSTP) IEEE 802.1Q VLAN Tagging IEEE 802.1p Prioritization IEEE 802.1x Port Authentication IEEE 802.1ab Link Layer Discovery Protocol (LLDP) IEEE 802.1AB LLDP-MED IEEE 802.3af Power over Ethernet (PoE) IEEE 802.3at High Power over Ethernet (PoE+) IEEE 802.3az Energy Efficient Ethernet (EEE) ITU-T G8032v1/v2 Ethernet Ring Protection Switching (ERPS)

4.6.6 Environmental Conditions

Table 17: Technical Data – Environmental Conditions

Surrounding air temperature (operation)	-40 ... +60 °C
Surrounding air temperature (storage)	-40 ... +85 °C
UL 61010 Use Pollution degree	Indoor 2
Relative humidity (operation)	10 ... 95 % (without condensation)
Relative humidity (storage)	5 ... 95 % (without condensation)
Vibration resistance	Acc. IEC 60068-2-6
Shock resistance	Acc. IEC 60068-2-27
EMC-1 immunity to interference	EN 55024 IEC 61000-4-2 IEC 61000-4-3 IEC 61000-4-4 IEC 61000-4-5 IEC 61000-4-6 IEC 61000-4-8 EN 61000-6-2
EMC-1 Emission of interference	FCC Part 15 Subpart B Class A EN 55011: Class A EN 55032: Class A EN 61000-6-4

4.7 Approvals

The following approvals have been granted for the WAGO ETHERNET accessory product “Lean Managed Switch” (852-1813/000-001):

 Conformity Marking

 Ordinary Locations UL61010-2-201 (E175199)

5 Mounting

5.1 Installation Site

The location selected to install the Lean Managed Switch may greatly affect its performance. When selecting a site, we recommend considering the following rules:

- Install the Lean Managed Switch at an appropriate place. See section “Device Description” > ... > “Technical Data“ for the acceptable temperature and humidity operating ranges.

Make sure that the heat output from the Lean Managed Switch and ventilation around it is adequate. Do not place any heavy objects on the Lean Managed Switch.

5.2 Installation on a Carrier Rail

The carrier rail must optimally support the EMC measures integrated into the system and the shielding of the internal data bus connections.

Place the Lean Managed Switch onto the DIN rail from the top and snap it into position.

5.3 Removal from Carrier Rail

To remove the Lean Managed Switch from the carrier rail, insert a suitable tool into the metal tab under the switch and deflect the metal tab downward.

You can then release the switch down from the carrier rail and remove it upwards.

6 Connect Devices

6.1 Power Supply

The switch uses direct current power supply for 24 ... 57 V.

The primary and secondary network link is established via a 6-pin plug-in connection located on the top of the Lean Managed Switch.

The female connector (Item No. 2231-106/026-000) is composed of six connecting terminals and can be inserted and removed easily by hand to connect to the 6-pin plug connector located on the top of the switch.

The power supply for the switch automatically adjusts to the local power source and can also be switched On if no or not all patch cables are connected.

1. Connect a suitable grounding conductor to the grounding lug on the top of the switch.
2. Plug the female connector into the male connector of the switch if it has not already been plugged in. Check the tight fit of the multipoint connector by gently shaking it.
3. PWR +/-:
To connect or disconnect the conductors, actuate the spring directly in the female connector using a screwdriver or an operating tool and insert or remove the conductor.
4. Check whether the power LED "PWR" on the top of the device lights up when power is supplied to the device. If not, check to ensure that the power cable is plugged in correctly and fits securely.
5. RPS +/-:
To connect or disconnect the conductors, actuate the spring in the female connector directly using a screwdriver or an operating tool and insert or remove the conductor.
6. Check whether the power LED "RPS" on the top of the device lights up when power is supplied to the device. If not, check to ensure that the power cable is plugged in correctly and fits securely.

6.2 External Alarm Contact Port

The Lean Managed Switch has an alarm contact connection on the top panel. For detailed instructions on how to connect the alarm contact power wires to the two ALM contacts of the 6-pin female connector, please refer to section “Power Supply (PWR/RPS)” (it is the same procedure).

You can connect the alarm circuit to any warning device already installed in the user's control room or factory floor. When a fault occurs, the Lean Managed Switch sends a signal through the alarm contact to activate the external alarm. The alarm contact has two ports that form a fault circuit for connecting to alarm systems.

An alarm is signaled in the following cases:

- 1 PWR/RPS:
 - a Power failure (power cord is disconnected, power supply malfunction, etc.)
 - b Input power falls outside specification (24 ... 57 V)

6.3 1000Base-SX/-LX/-ZX Port, 100BASE-FX Port, Fiber Optic

When connecting a fiber optic cable to a 1000Base-SX/-LX/-ZX port or to a 100BASE-FX port on the industrial switch, make sure to use the right connector type (LC) and SFP module.

There are various types of multi-mode, single mode or WDM SFP modules. Follow the steps below to connect the fiber optic cable properly:

Note

Rubber covers

Remove and safely store the rubber covers of the fiber optic port (LC).

If no fiber optic cable is connected, the rubber cover should be installed to protect the fiber optics.

-
- 1 Insert the respective SFP modules.
 - 2 Ensure that the fiber optic ports are clean. You can clean the cable connectors by wiping them with a clean cloth or a cotton ball soaked with a little ethanol. Dirty fiber optic cables affect the quality of the light transmitted via the cable and leads to reduced performance at the port.
 - 3 Connect one end of the fiber optic cable to the LC port of the industrial switch and the other end to the fiber optic port of the other device.

Note

Proper connection of the fiber optic cable to the SFP module

For a proper connection, snap the connector of the fiber optic cable into the SFP module audibly.

-
- 4 Check the respective port LED on the industrial switch that the connection is established (see section “Device Description” > ... > “Display Elements”).

6.4 10/100/1000BASE-T Ports

The 10/100/1000BASE-T ports (RJ-45 ETHERNET ports) of the industrial switch support both autosensing and autonegotiation.

NOTICE

Do not connect data connections between PoE ports of devices with the same potential!

If PoE switches use the same voltage supply (same potential), the PoE ports must not be connected directly to each other.

The resulting short-circuit current will damage the switches.

Please refer to the section “Data Connection between PoE Switches / PSE (Power Sourcing Equipment)” for more information.

- 1 Connect one end of the twisted pair cable of the type Category 3/4/5/5e to an available RJ-45 port on the industrial switch and the other end to the port of the selected network node.
- 2 Check the respective port LED on the industrial switch that the connection is established.
(see section “Display Elements” > ... > “Port LEDs”).

6.5 Data Connection between PoE Switches / PSE (Power Sourcing Equipment)

Use the SFP slots to establish a data connection between two PoE switches.

Figure 11: Data connection 01

When establishing a data connection between two PoE switches via the PoE ports with a copper cable, two separate potentials must be used for the power supply of the switches.

NOTICE

Use two separate potentials!

If the voltage supplies of both PoE switches have the same potential, a short circuit can occur.

The resulting short-circuit current damages the switches.

Figure 12: Data connection 02

Figure 13: Data connection 03

Figure 14: Data connection 04

Establishing a data connection between a non-PoE-capable switch and a PoE-capable switch is not subject to this condition.

Figure 15: Data connection 05

7 Configuration

7.1 Overview of Configuration Options

The Lean Managed Switch provides three options for advanced management features:

7.1.1 Web Based Management

A menu-driven user interface can be called up from the WBM (“**W**eb **B**ased **M**anagement”) via the protocols “http” or “https”.

Note

Standard setting

By default, the Lean Managed Switch is set to the “http” protocol.

Note

Using Protocol “https”

If you use the protocol “https”, you must activate this service (see Section “Service Control”).

Note

Additional Information

Please refer to the section “Configuration in the Web Based Management (WBM)” for a detailed description.

7.1.2 Telnet or SSH Connection

1. Connect the computer to one of the ETHERNET ports.
2. Open a Telnet/SSH session to the switch’s IP address. If this is your first login, use the default values.

Table 18: Default Settings for the Telnet Port

Setting	Default Value
IP Address	192.168.1.254
Subnet Mask	255.255.255.0
Default Gateway	0.0.0.0
Management VLAN	1
Default Username	admin
Default Password	wago

3. Make sure your computer IP address is in the same subnet, unless you are accessing the switch through one or more routers.

Note

Using Protocol “Telnet”

If you use the protocol “telnet”, you must activate this service (see Section “Configuration in the Web Based Management (WBM)” > ... > “Service Control”).

7.1.3 Access via Console Port (CLI)

The following describes how to view the device configuration using the command line interface.

1. Connect the computer over SSH or Telnet to the Command Line Interface (CLI) of the switch.
2. Press **[ENTER]** to open the login screen.

```
L2SWITCH login:
```

3. Enter **[admin]** to go to CLI mode.

```
L2SWITCH login: admin
L2SWITCH>
```

4. Enter **[enable]** to switch to privileged mode. Use the following default values for the username and password.

```
L2SWITCH>enable
user:admin
password: wago
```

5. Enter **[show running config]** to see the current device configuration.

```
L2SWITCH#show running-config
```

Note

Additional Information

Please refer to the Section “Appendix” > ... > “Configuring in the Command Line Interface (CLI)” for a detailed description.

8 Diagnostics with Dashboard and Topology Map

Diagnostic will help user and network administrators for quick reference, diagnosing and identifying problems within a system and network. It is a type of network management that helps in finding network connectivity, performance and other related problems in a dashboard.

Note

Changing the colors of the tiles when the threshold value changes

For easy diagnosis, you can set a change in the colors (red, yellow, green) of the tiles when the threshold values are exceeded or not reached (see Section “Dashboard Configuration”).

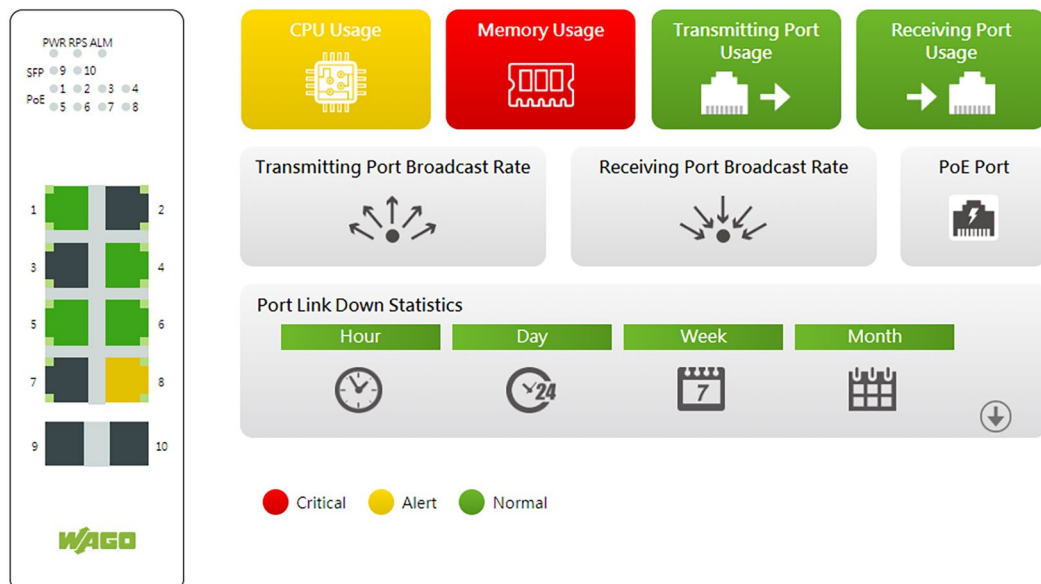

Figure 16: Dashboard (Example)

Note

Display of the LEDs "PWR" and "RPS" in the Diagnostic Dashboard

The “PWR” and “RPS” LEDs are not displayed on the Diagnostic Dashboard.!

8.1 Web Based Management for Diagnostic Function

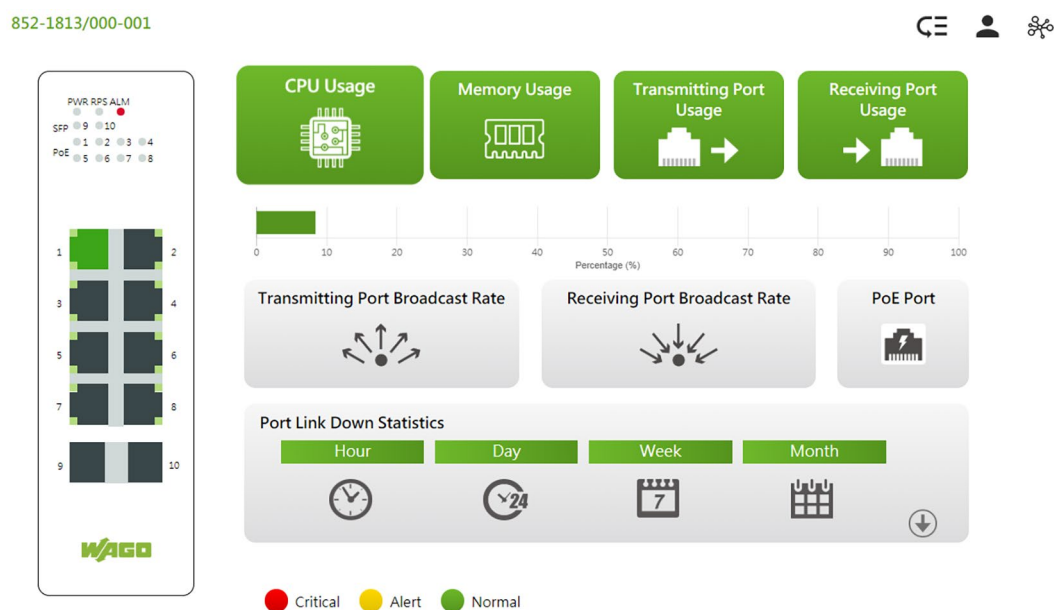

Figure 17: Dashboard

8.1.1 CPU Usage

User can get the switch CPU usage information in % by just one click shown below.

Figure 18: CPU Usage

8.1.2 Memory Usage

User can get the switch memory usage information in % by just one click shown below.

Figure 19: Memory Usage

8.1.3 Transmitting Port Usage

User can get the switch port Tx utilization information in % by just one click shown below.

Figure 20: Transmitting Port Usage (Example)

8.1.4 Receiving Port Usage

User can get the switch port Rx utilization information in % by just one click shown below.

Figure 21: Receiving Port Usage (Example)

8.1.5 Transmitting Port Broadcast Rate

The user can get the Transmitting Port Broadcast Rate for every port.

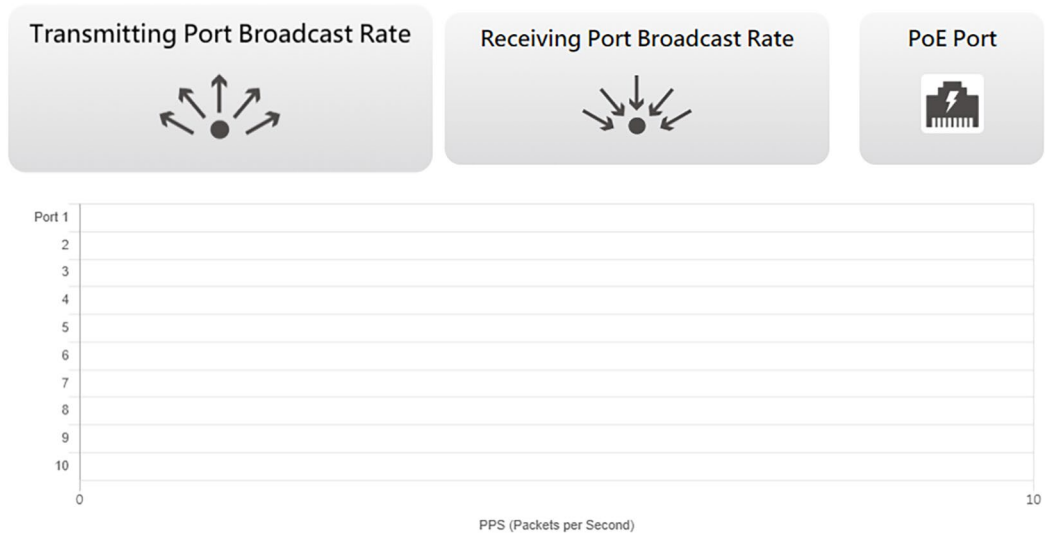

Figure 22: Transmitting Port Broadcast Rate

8.1.6 Receiving Port Broadcast Rate

The user can get the Receiving Port Broadcast Rate for every Port.

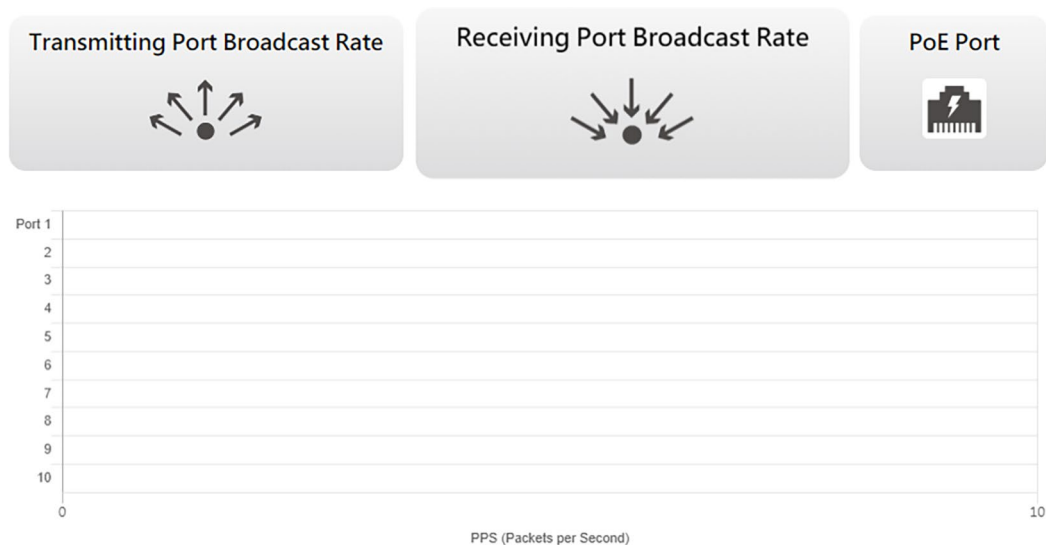

Figure 23: Receiving Port Broadcast Rate

8.1.7 PoE Port

The user get the emitted PoE power per port.

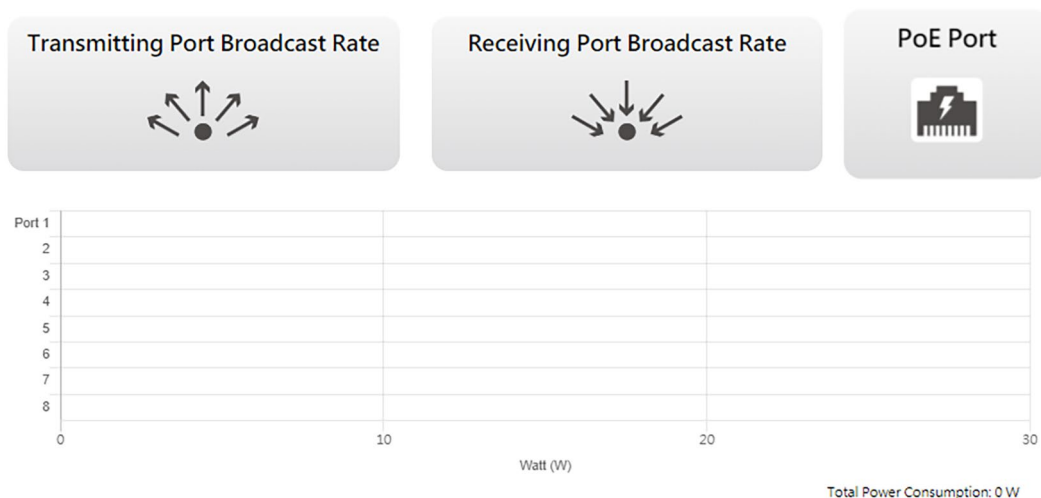

Figure 24: PoE Port

8.1.8 Port Link Down Statistics

User can get the summary of the port link down statistics per hour, day, week and month wise information in just one click shown below.

With this function, a loose contact or broken cable of a network cable can be localized fast and easy.

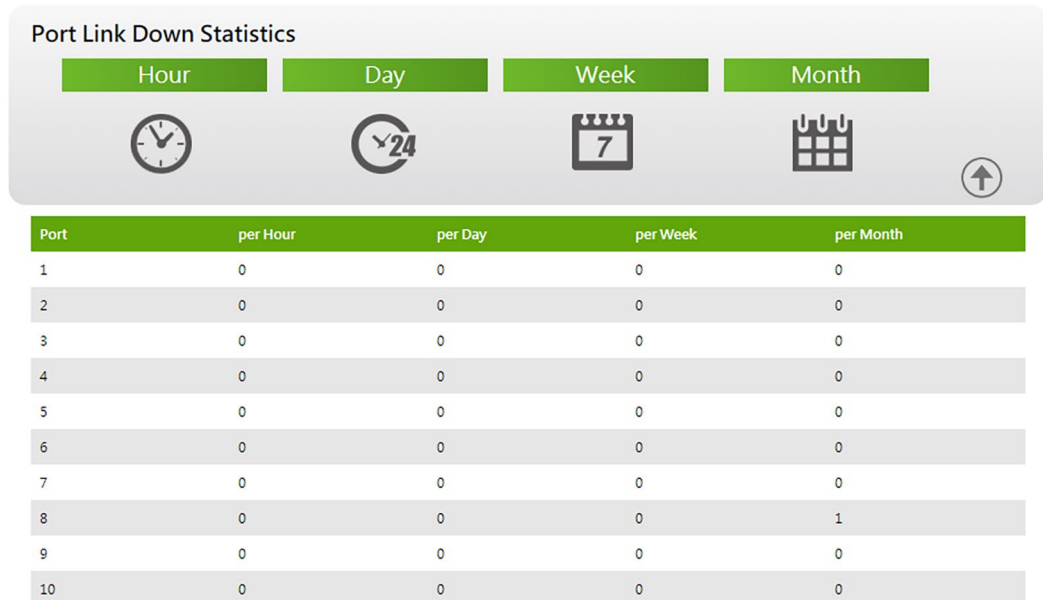

Figure 25: Port Link Down Statistics (Example)

8.2 Mouse pointer in the Diagnostic Dashboard

User can get the detailed information of the Alarm, Alert, utilization by just pointing the cursor on specified as shown below.

Figure 26: LED Information

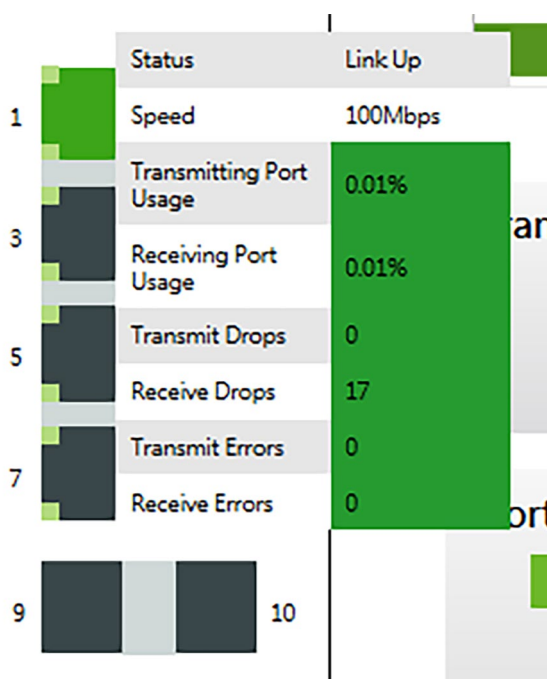

Figure 27: Port Information per Port (Example)

By analyzing the faulty data packets (e.g. Transmit Errors), errors during cable laying can be detected at an early stage.

8.3 Collapse, User Login, Topology Map

Collapse option	is used for the user to get back to home in the dashboard.
User Login option	is to login to the device for further configuration and maintenance.
Topology Map	will show the user about the connectivity.

Figure 28: Collapse, User Login, Topology Map

Once user select login it will redirect to switch login window and below screen will appear.

The login screen features the WAGO logo at the top. Below it, the hostname 'L2SWITCH' and description '852-1813_000-001' are displayed. There are two input fields: 'Username' and 'Password'. A green 'Login' button is positioned at the bottom right of the form.

Figure 29: Log in

Table 19: Login Screen

Setting	Default Value
Default username	admin
Default password	wago

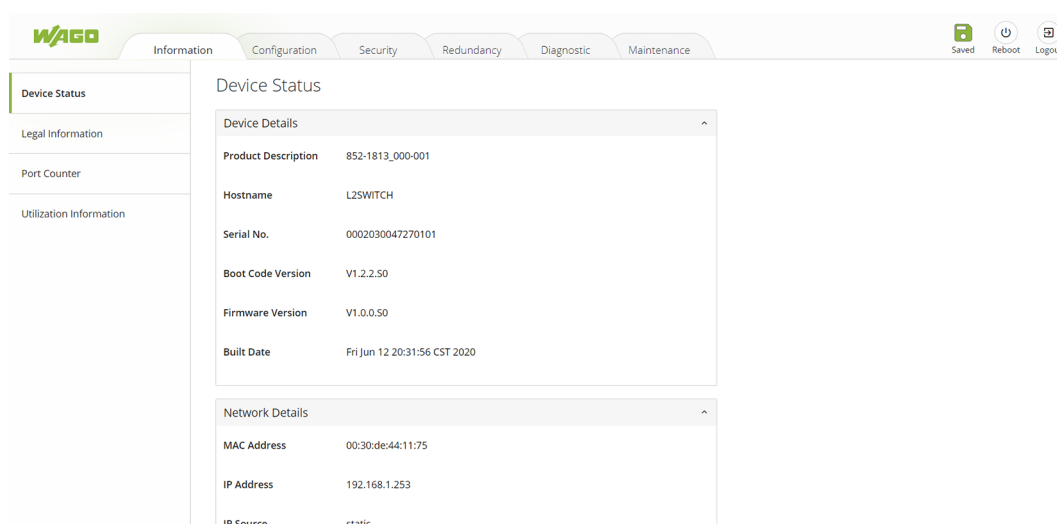

Figure 30: Tab "Information" – Menu "Device Status"

Note

The Web Based Management (WBM)

For a detailed description of the configuration in Web Based Management (WBM), see Section "Configuration in the Web Based Management (WBM)".

Once user select Topology map option it will appear get to network connectivity connected to this device as shown below.

The switch offers lean network management:

Diagnostics are intuitive and can be performed without IT knowledge. The topology map clearly displays the switch and the connected nodes. Important diagnostic information is visualized.

If the connection is interrupted at a port, the connection line changes color to red.

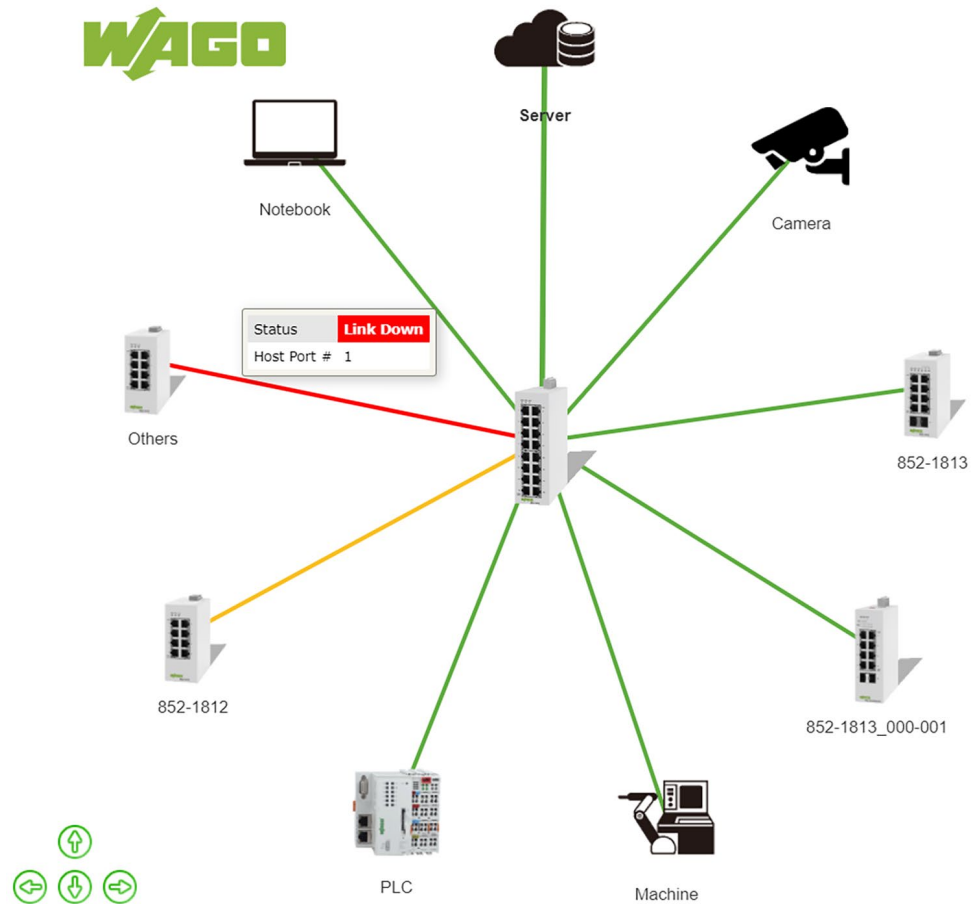

Figure 31: Topology Map – Link Down Port 1

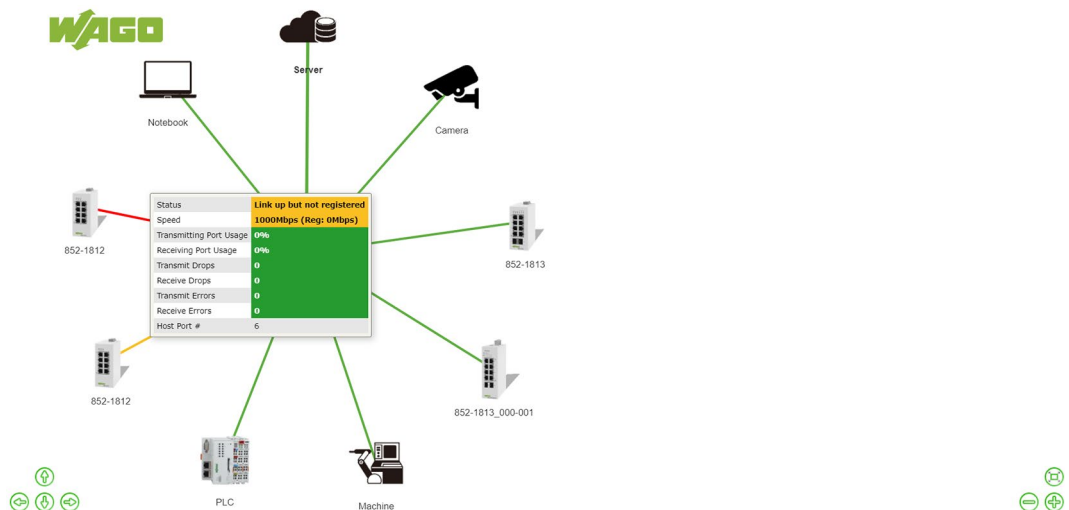

Figure 32: Topology Map – Link not registered

Figure 33: Topology Map – Link Information

9 Configuration in the Web Based Management (WBM)

An internal file system and integrated Webserver can be used for configuration and administration of the system. Together, they are referred to as the Web-Based Management (WBM) system.

The HTML pages saved internally provide you with information about the configuration and status of the fieldbus node. In addition, you can also change the configuration of the device here.

You can also save HTML pages you created yourself via the implemented file system.

Note

Always restart after making changes to the configuration!

The system must always be restarted for the changed configuration settings to take effect.

1. To open the WBM, launch a Web browser (e. g. Google Chrome or Mozilla Firefox).

Note

Standard setting

By default, the Lean Managed Switch is set to the "http" protocol.

Note

Using Protocol "https"

If you use "https", you must activate this service (see Section "Service Control").

2. Enter the IP address of the switch.
3. Click **[Enter]** to confirm.
4. Enter your user name and password in the query dialog:

User = "admin"
Password = "wago"
5. The start page of WBM loads.
6. Make the desired settings.
7. Click **[Submit]** to confirm your changes, or click **[Delete]** to discard your changes.
8. To apply the settings, confirm your changes with the **[Save]** button.

You can access the corresponding WBM pages via the links in the navigation bar:

RX Port Utilization (bps)		This column displays RX bandwidth utilization in bps.

9.2 Configuration

9.2.1 Device Discovery

9.2.1.1 LLDP

The LLDP (“Link Layer Discovery Protocol”) described in this standard allows stations connected to a LAN according to IEEE 802® to send information to other stations connected to the same LAN. The information includes essential system functions, including the management address or addresses of an entity or entities that provide management of these functions, as well as identification of the station’s access point to the IEEE802 LAN required by the management entity or entities.

Note

For LLDP protocol devices.

If enabled, LLDP protocol devices information will appear on the topology map. The switch information will be shared with other devices connected within the same network

LLDP

System Name		In the input field, enter the system name of the device.

9.2.2 Interface

9.2.2.1 Loop Detection

“Loop Detection” handles problems with loops in the network periphery. These problems can occur if a port is connected to a switch that is in a loop state. A loop state occurs as a result of user error. It happens when two ports on a switch are connected with the same cable. When a switch in loop state sends out broadcast messages, the messages loop back to the switch and are re-broadcast again and again, causing a “Broadcast Traffic flooding.”

The “Loop Detection” function sends probe packets periodically to detect whether the port is connected to a network in loop state. The switch shuts down a port if the switch detects probe packets looping back to the same port.

9.2.2.1.1 Loop Recovery

When “Loop Detection” is enabled, the switch sends a probe packet every two seconds and waits to receive the packet. If it receives the packet at the same port, the switch disables the port. After a defined time period (“Recovery Time”), the switch re-enables the port and executes “Loop Detection” again.

The switch generates a “Syslog” (system log), internal log messages and “SNMP Traps” if it disables a port after “Loop Detection.”

Note

Loop detection

Loop detection is a link-layer protocol designed for Ethernet networks. An interface with loop detection enabled identify and remove the loops in the same network.

9.2.2.2 Mirror

Port mirroring is used on switches to send a copy of network packets sent/received on one switch port or a range of switch ports to a network monitoring connection on another switch port (Monitor Port).

Port mirroring is used in network systems that require monitoring of network traffic, such as an IDS (“Intrusion Detection System”).

Port mirroring, together with an NTA (“Network Traffic Analyzer”), can help to monitor network traffic. Users can monitor the selected ports (“Source Ports”) for egress and/or ingress packets.

Source Mode

- “Ingress”: The incoming data packets are copied and forwarded to the monitor port.
- “Egress”: The outgoing data packets are copied and forwarded to the monitor port.

Note

Important Note!

1. The monitor port cannot be a trunk member port.
 2. The monitor port cannot be an ingress or egress port.
 3. If a port has been configured as a source port and the user configures the port as a destination port, the port will be removed from the source ports automatically.
-

Note

Using the Port Mirroring

The Port Mirroring is used for network monitoring by sending a copy of entering or existing network packets on a port of the switch to one or a range of switch ports.

9.2.2.3 Port Setup

9.2.2.3.1 Port Settings

Duplex Mode

A duplex communication system is a system composed of two connected devices that can communicate with each other in both directions.

Half-Duplex

A half-duplex system provides for communication in both directions, but only one direction at a time (not simultaneously).

One device receives a signal and must wait for the other device to stop transmitting before replying.

Figure 45: Half-Duplex Mode

Full-Duplex

A full-duplex system (also known as a double-duplex system) can communicate simultaneously in both directions.

Fixed-line telephone networks, for example, are full-duplex, since both callers can talk and listen at the same time.

Figure 46: Full-Duplex Mode

Auto MDI/MDIX

MDI (“**M**edium-**D**ependent Interface”) is part of the transmitter/receiver unit (transceiver) of a network device.

Auto-MDIX (“**A**utomatic **M**edium-**D**ependent Interface **C**rossover”) is a network technology integrated in the port that automatically detects the required network cable type (“Straight-through” or “Crossover” cable) and configures the connection accordingly.

“Crossover” cables are then unnecessary for connecting devices.

The interface corrects incorrect cabling automatically.

For Auto-MDIX to work properly, the speed must be set to “Auto” for the interface and in the duplex settings.

Auto-Negotiation

Auto-negotiation is a method in which two interconnected ETHERNET network ports (e.g., the network port of a PC and a port of a router, hub or switch that is connected to it) independently negotiate and configure the maximum transmission speed and the duplex process.

Auto-negotiation only applies to twisted-pair cables – not to WLAN, fiber optic or coaxial cable connections.

If the port does not support auto-negotiation or turns off this feature, the switch determines the connection speed by detecting the signal on the cable and using half duplex mode.

If auto-negotiation is enabled on the switch, a port uses its pre-configured settings for speed and duplex mode when establishing the connection.

This should ensure that the same settings have been made on the port, allowing the connection to be established.

Flow Control

“Flow Control” regulates the transmission of signals by adjusting them to the bandwidth on the input port.

Higher data traffic on the port decreases the bandwidth and can overflow the buffer memory, which can lead to packet and frame loss.

According to IEEE 802.3x, the switch uses “Flow Control” in full-duplex mode and “Backpressure Flow Control” in half-duplex mode.

With flow control, the switch is used in full-duplex mode to send a pause signal to the sending port, causing it to temporarily stop sending signals when the receiving port memory buffers fill.

For “Backpressure Flow Control”, the switch sends a collision signal to the sending port in half-duplex mode (mimicking a state of packet collision), causing the sending port to temporarily stop sending signals and to resend the signals later.

Note

Support for “Force Mode”

1000 BASE-T does not support “Force Mode”.

Note

9.2.2.4 Port Priority

Typically, networks operate on a best-effort delivery basis, which means that all data traffic per port has equal priority and an equal chance of being delivered in a timely manner. When congestion occurs, all data traffic per port has an equal chance of being dropped.

Using Port Priority feature, you can select specific network traffic, and prioritize it according to its relative importance. Implementing Port Priority in your network makes network performance more predictable and bandwidth utilization more effective.

Note

Select the priority of ports

Range of ports can be selected to priority of low/medium/high.

Port Priority

9.2.3.2 PD Alive Check

The function has a global state configuration. If the global state configuration is enabled. The Switch will check the configurations of every port.

If the port's state is enabled, the Switch will send keep-a-live probe packet every interval time. If the host cannot respond when the keep-a-live probe packet count is over the retry times, the Switch performs the action, reboot/alarm/all to the Power Device, depending on the port's configuration.

Interval Time (sec)

Device will send checking message to PD each interval time.

Action

The action when the failure detection.

- All: Send an alarm message to inform the administrator and then reboot the PD.
- Alarm: Just send an alarm message to inform the administrator.
- None: Keep Ping the remote PD but does nothing further.
- Reboot: Cut off the power of the PoE port, make PD rebooted.

Power OFF Time (sec)

When PD has been rebooted, the PoE port restored power after the specified time.

PD Startup Time (sec)

When PD has been start up, the switch will wait Start up time to do PoE Auto Checking.

Note

Automatically check of the live status of powered devices (PDs)

The live status of powered devices (PDs) are automatically checked. PDs alive state and range of ports can be configured to verify the connected device status.

PD Alive Check

PD Alive Check Settings

Note: The live status of powered devices (PDs) are automatically checked. PDs alive state and range of ports can be configured to verify the connected device status.

9.2.4 SNMP

SNMP (“**S**imple **N**etwork **M**anagement **P**rotocol”) is used in network management systems to monitor network-attached devices for conditions that warrant administrative attention. SNMP is a component of the Internet Protocol Suite as defined by the Internet Engineering Task Force (IETF). It consists of a set of standards for network management, including an application layer protocol, a database schema, and a set of data objects.

SNMP exposes management data in the form of variables on the managed systems, which describe the system configuration. These variables can then be queried (and sometimes set) by managing applications.

An “SNMP community string” is a text string that acts as a password. It is used to authenticate messages that are sent between the management station (the SNMP manager) and the device (the SNMP agent). The string is included in every packet transmitted between the SNMP manager and the SNMP agent.

The “SNMP community” acts like a password and is used to define the security parameters of SNMP clients in an SNMP v1 and SNMP v2c environments. The default “SNMP community” is “public” for both SNMPv1 and SNMPv2c before SNMPv3 is enabled. Once SNMPv3 is enabled, the “Communities” of SNMPv1 and v2c have to be unique and cannot be shared.

9.2.4.1 Event Settings

9.2.5.2 SNTP

SNTP (“**S**imple **N**etwork **T**ime **P**rotocol”) is a protocol for synchronizing clocks in computer systems. It is a less complex implementation of an NTP (“**N**etwork **T**ime **P**rotocol”).

SNTP uses UTC – “**C**oordinated **U**niversal **T**ime” (French: “**T**emps **U**niversel **C**oordonné”). No information on time zones or daylight savings time is transmitted. This information falls outside the protocol range and must be obtained separately.

The SNTP port is 123.

Note

Note!

1. The SNTP server always replies the current UTC time.
 2. If the switch receives the SNTP reply time, it adjusts the time to the time zone configuration and configures the time for the switch accordingly.
 3. If the time server's IP address is not configured, the switch does not send an SNTP request packet.
 4. If the switch does not receive an SNTP reply packet, it repeats the challenge indefinitely every ten seconds.
 5. If the switch receives an SNTP reply, it repeats the time request from the NTP server every hour.
 6. If the time zone and NTP server changes, the switch repeats the request process.
 7. No default SNTP server.

Start Date ¹⁾		Enter the date and time for the start of daylight savings if you have enabled this option. The time is displayed in 24-hour format.
End Date ²⁾		Enter the date and time for the end of daylight savings if you have enabled this option. The time is displayed in 24-hour format.
¹⁾	<p>Daylight savings starts on the second Sunday of March in most places in the USA. Daylight savings starts at 2 A.M local time in each time zone in the USA. Correspondingly, you would select "Second, Sunday, March" and "2:00".</p> <p>In the EU, daylight savings starts on the last Sunday in March. It starts at the same time (1:00 A.M GMT or UTC) in all EU time zones. Correspondingly, you would select "Last, Sunday, March") and in the last field, enter the time based on your time zone. In Germany, for instance, you would select "2:00" because Germany's time zone is one hour ahead of GMT or UTC (GMT+1).</p>	
²⁾	<p>In the USA, daylight savings ends on the last Sunday in October. It ends at 2:00 A.M. local time in each time zone in the USA. Correspondingly, you would select "First, Sunday, November" and "2:00".</p> <p>In the EU, daylight savings ends on the last Sunday in October. Daylight savings ends at the same time (1:00 AM GMT or UTC) in all EU times zones. Correspondingly, you would select "Last, Sunday, October") and in the last field, enter the time based on your time zone. In Germany, for instance, you would select "2:00" because Germany's time zone is one hour ahead of GMT or UTC (GMT+1).</p>	

9.2.5.3 User Account

The switch allows users to create up to six user accounts. The user name and password must be a combination of numbers or letters. The last admin account cannot be deleted. To use the CLI or Web-Based Management, a user has to be logged into a valid user account.

User Permissions

The switch supports two types of user accounts:

The default user accounts have the following credentials:

User Name = "admin"

User Password = "wago"

- | | | |
|----|---------------------|-----------------------------------------------------------------|
| 1. | Admin account | Read/Write permissions |
| 2. | Normal user account | Read permission only |
| | | - Use of the privileged mode in the CLI is not possible. |
| | | - Configurations cannot be changed in the Web-Based Management. |

Note

User Account Setting

User Account Setting is to configure user authority to access the switch or to access networks for 802.1X.

		<div></div> <div>Note Deleting an administrator account The last admin account cannot be deleted.</div>

9.2.6 Storm Control

A broadcast storm occurs when the network is overwhelmed with constant broadcast or multicast traffic. Broadcast storms can eventually lead to a complete loss of network connectivity as the packets proliferate.

“Storm Control” protects the switch bandwidth from packet flooding, including broadcast packets, multicast packets and DLF (“**D**estination **L**ookup **F**ailure”). The Rate is a threshold that limits the total number of specific packet types. For example, if the broadcast and multicast options are selected, the total number of packets transmitted per second for these two types is not exceeded.

“Broadcast Storm Control” limits the number of broadcast, multicast and unknown unicast (also referred to as “Destination Lookup Failure” or DLF) packets the switch receives per second on the ports. If the maximum number of packets per second is reached, all subsequent packets are discarded. Enable this function to reduce the number of these packets in the network.

The default rate is 300 packets per second for Broadcast and DLF. You can set to maximum rate of 5000 packets per second for Multicast, Broadcast or DLF.

Note

Function of the Storm Control feature

The Storm Control feature prevents switch ports on a LAN from being disrupted by a broadcast, multicast or unknown unicast storm on one of the interfaces.

DLF Rate (pps)		This column displays the DLF traffic flooding control state on the port.

9.3 Security

9.3.1 802.1X

9.3.1.1 IEEE 802.1X Communication Standard

IEEE 802.1X is an IEEE standard for port-based Network Access Control (“port” meaning a single point of attachment to the LAN infrastructure). It is part of the IEEE 802.1 group of networking protocols. It provides an authentication mechanism for devices wishing to attach to a LAN, either establishing a point-to-point connection or preventing it if authentication fails. It is used for most wireless 802.11 access points and is based on EAP (“**E**xtensible **A**uthentication **P**rotocol”).

IEEE 802.1X provides port-based authentication, which involves communications between a so-called supplicant, authenticator and authentication server. The supplicant is often software on a client device, such as a laptop, the authenticator is a wired ETHERNET switch or wireless access point, and the authentication server is generally a RADIUS (“**R**emote **A**uthentication **D**ial-In **U**ser **S**ervice”) database.

The authenticator acts like a security guard for the protected network. The supplicant (e.g., client device) is not allowed access the protected side of the network through the authenticator until the supplicant’s identity is authenticated. With 802.1X port-based authentication, the supplicant provides credentials, such as a user name/password or digital certificate, to the authenticator, and the authenticator forwards the credentials to the authentication server for verification. If the credentials are valid (in the authentication server database), the supplicant (client device) is allowed to access resources located on the protected side of the network.

Upon detection of a new client (“supplicant”), the port on the switch (“authenticator”) is enabled and set to the “unauthorized” state. In this state, only 802.1X traffic is allowed; other traffic, such as DHCP and HTTP, is blocked on the network layer (Layer 3). The authenticator sends out the EAP identity request to the supplicant, the supplicant responds with the EAP response packet, which the authenticator forwards to the authenticating server. If the authenticating server accepts the request, the authenticator sets the port to the “authorized” mode, and normal traffic is allowed. If the supplicant logs off, it sends an EAP logoff message to the authenticator. The authenticator then sets the port to the “unauthorized” state, once again blocking all non-EAP traffic.

RADIUS Server

The RADIUS server (“**R**emote **A**uthentication **D**ial-In **U**ser **S**ervice”) is a client/server-based security protocol for authentication and control of network access permissions.

The RADIUS server operates using the Challenge/Response process and supports central administration of user data, such as user ID, passwords, phone numbers, access rights and account data, and consists of an accounting and authentication protocol.

In combination with DHCP and PPP, configuration of dial-in systems can occur automatically with RADIUS.

Figure 67: IEEE 802.1X

The following figure illustrates how a client connecting to an IEEE 802.1X-authentication-enabled port goes through the validation process. The switch prompts the client for login information in the form of a user name and password.

Once the client provides the login credentials, the switch sends an authentication request to the RADIUS server. The RADIUS server checks whether this client is allowed access to the port.

Figure 68: RADIUS Server

Local User Accounts

By storing user profiles locally on the switch, the switch can authenticate users without interacting with the network authentication server. However, there is a limit to six users that can be authenticated in this way.

Guest VLAN

The Guest VLAN function in IEEE 802.1X port-based authentication on the switch provides limited services to clients, such as downloading the IEEE 802.1X client. These clients can update their system for IEEE 802.1X authentication.

If you enable a guest VLAN on an IEEE 802.1X port, the switch assigns clients to a guest VLAN when the switch does not receive a response to its EAP request/identity frame or when EAPOL ("EAP over LAN") packets are not sent by the client.

Port Parameters

- **Admin Control Direction**

Both	- If 802.1X port authentication for a user has failed, incoming and outgoing packets on the port are dropped.
Incoming	- If 802.1X port authentication for a user has failed, only incoming packets on the port are dropped.
- **Re-Authentication**

This function specifies whether a subscriber must periodically re-enter his or her user name and password to stay connected to the port.
- **Reauth Period**

The "Reauth Period" function is used to specify how often a client has to re-enter his or her username and password to stay connected to the port. The permissible range for this field is 0 to 65535 seconds.
- **Port Control Mode**

"Auto"	Users can access the network after authentication.
"Force-authorized"	Users can access the network without authentication.
"force-unauthorized"	Users cannot access the network.

- **Quiet Period**
The “Quiet Period” function is used to specify the time a client has to wait before the next authentication attempt. This prevents the switch from becoming overloaded with continuous authentication attempts from the client. The permissible range for this field is 0 to 65535 seconds.
- **Server Timeout**
The “Server Timeout” value is used for timing out the authentication server.
- **Supp Timeout**
The “Supp Timeout” value is the initialization value used for timing out a supplicant.
- **Max Req Time**
The “Max Req Time” specifies how often the switch attempts to connect to the authentication server before determining that the server is down. The permissible range for this field is 1 to 10 attempts.

9.3.1.2 Global Setup

Note

Activate 802.1X authentication

Select enable to permit 802.1X authentications on the switch for security purposes. You must first enable 802.1X authentications on the switch before configuring it on each port.

802.1X

9.3.2 ACL

The ACL (“**A**ccess **C**ontrol **L**ist”) is a list of permissions attached to an object. The list specifies who or what is allowed to access an object and what operations are allowed to be performed on the object.

The ACL function allows users to configure a few rules to reject packets from the specific ingress ports or all ports. These rules check the source and destination MAC addresses of packets. If packets match these 32 rules, the system executes the “deny” action, meaning it rejects these packets.

The “Action Resolution Engine” collects the information (action and metering results) from the hit entries: If more than one rule matches, the actions and measurements/counters are taken from the policy associated with the matched rule with highest priority.

Note

Permissions of the Access Control List (ACL)

L2 Access Control List (ACL) is a list of permissions attached an object with an maximum of 32 ACL settings allowed. State > Drop specifies who or what is denied access to the object.

9.3.3 Port Security

The switch receives the MAC address of a device that is connected to a specific port direction and allows data forwarding. The functions of the switch allow control over which and how many devices may be connected to a switch port.

The “Port Security” functions can specify the maximum number of MAC addresses per interface. If this number is exceeded, incoming packets with new MAC addresses are dropped. A MAC address table can be used to check this. The static MAC addresses are included for this limit.

Note

State Change of a Port on the Switch

If the state of a port on the switch is changed from disabled to enabled, all MAC addresses captured by this port are dropped.

Note

Configuration of the Port Security

Port security configuration will allow the user to configure MAC limitations to permit the interface.

9.3.5 VLAN

9.3.5.1 Port Isolation

Port isolation is a port-based virtual LAN feature. It partitions the switching ports into virtual private domains designated on a per port basis. Data switching outside of the switch's private domain is not allowed. The VLAN tag information of the packets is ignored.

This feature is a per-port setting to configure the egress port(s) for the specific port to forward its received packets. If the CPU port (port 0) is not an egress port for a specific port, the host connected to the specific port cannot manage the switch.

If you wish to allow two subscriber ports to talk to each other, you must define the egress port for both ports. CPU refers to the switch's management port. By default, it forms a VLAN with all ETHERNET ports. If it does not form a VLAN with a specific port, then the switch cannot be managed from that port.

Note

Configure the ports

Range of ports can be configured. It partitions the switching ports into virtual private domains designated on a per-port basis, if the user wants to communicate port 1 to port 2 only, then configure of port isolation can help to talk both the port only.

9.3.5.2 VLAN Setup

A VLAN (“**Virtual LAN**”) is a group of hosts with a common set of requirements that communicate as if they were attached to a broadcast domain, regardless of their physical location. A VLAN has the same attributes as a physical LAN, but it allows for end stations to be grouped together even if they are not located on the same network switch. Networks can be reconfigured through software instead of spatially separated devices.

VID (“**VLAN-ID**”) is the identification of a VLAN that is generally used by the IEEE 802.1Q standard. It has 12 bits and allows the identification of 4096 (2^{12}) VLANs. Of the 4096 possible VIDs, VID 0 is used to identify “Priority Frames”, and value 4095 (FFF) is reserved, so the maximum possible number of VLAN configurations is 4094. But the Lean Managed Switch has max. 5 VLANs available.

A “Tagged VLAN” uses an explicit tag (VLAN ID) in the MAC header to identify the VLAN membership of a frame across “Bridges” – they are not confined to the switch on which they were created. VLANs can be created statically (manually by users) or dynamically via the GVRP (“GARP VLAN Registration Protocol”). The VLAN ID associates a frame with a specific VLAN and provides the information that switches need in order to process the frame across the network. A tagged frame is four bytes longer than an untagged frame and contains two bytes of TPID (“Tag Protocol Identifier”, residing within the type/length field of the “ETHERNET Frame”) and two bytes of TCI (“Tag Control Information”, which starts after the source address field of the “ETHERNET Frame”).

The CFI (“Canonical Format Indicator”) is a single-bit flag, always set to zero for ETHERNET switches. If a frame received at an ETHERNET port has a CFI of 1, the frame should not be output to an untagged port. The remaining 12 bits define the VLAN ID, giving a possible maximum number of 4096 VLANs. Note that the user priority and VLAN ID are independent of each other. A frame with VID (VLAN Identifier) of null (0) is called a priority frame, meaning that only the priority level is significant, and the default VID of the ingress port is used as the VID of the frame. Of the 4096 possible VIDs, a VID of 0 is used to identify “Priority Frames”, and value 4095 (FFF) is reserved, so the maximum possible number of VLAN configurations is 4094.

TPID	User Priority	CFI	VLAN ID
2 bytes	3 bits	1 bit	12 bits

- **Forwarded Tagged and Untagged Frames**

Each port on the switch is capable of forwarding tagged and untagged frames. When a frame is forwarded from an 802.1Q VLAN-aware switch to an 802.1Q VLAN-unaware switch, the switch first decides where to forward the frame and then strips off the VLAN tag. When a frame is forwarded from an 802.1Q VLAN-unaware switch to an 802.1Q VLAN-aware switch, the switch first decides where to forward the frame and then inserts a VLAN tag reflecting the ingress port’s default VID. The default PVID is “VLAN 1” for all ports, but this can be changed.

A broadcast frame (or a multicast frame for a multicast group that is known by the system) is duplicated only on ports that are members of the VID (except the ingress port itself), thus confining the broadcast to a specific domain.

Note

Create VLANs

Range of VLANs can be created, up to five VLANs. Recommend to set the trunk port to tag and join all port's vlan.

Note

Always one Port in the Management VLAN

There should always be one port in the Management VLAN.

Otherwise, the switch can not be configured.

It may be necessary to reset the switch to the factory settings. The configurations will be lost.

9.4 Redundancy

9.4.1 ERPS

The ERPS (“**ETHERNET Ring Protection Switching**”) function implements a protection switching mechanism for ETHERNET layer ring topologies according to ITU-T standard G.8032. The ERP (“**ETHERNET Ring Protection**”) protects ETHERNET traffic in a ring topology and ensures that no loops can arise within the ring in the ETHERNET layer. Looping is prevented by blocking traffic on either a predetermined link or a failed link.

The ETHERNET ring protection functionality includes the following:

- Loop avoidance
- Use of learning, forwarding and filter database (FDB) mechanisms

Loop avoidance in an Ethernet ring is achieved by guaranteeing that, at any time, traffic may flow on all but one of the ring links. This particular ring link serves as a reserve connection and is called an RPL (“**Ring Protection Link**”). In normal operation, it is blocked and not used for service traffic. A specific ETHERNET ring node, the “RPL Owner” node, is responsible for blocking traffic at one end of the RPL. Under an ETHERNET ring failure condition, the “RPL Owner” node is responsible for unblocking its end of the RPL, unless the RPL has failed, allowing the RPL to be used for traffic. The ETHERNET ring node adjacent to the RPL, the “RPL Neighbor” node, may also participate in blocking or unblocking its end of the RPL.

The ETHERNET rings can support a multi-ring/ladder network that consists of ETHERNET rings linked through one or more interconnection points. The protection switching mechanisms and protocol defined in this recommendation can be used for a multi-ring/ladder network under the following conditions:

- R-APS channels are not shared across ETHERNET ring connections;
- On each ring port, all traffic channels and all R-APS channels are controlled (e.g., for blocking or flushing) by the ETHERNET ring protection control process (ERP control process) of only one ETHERNET ring;
- Each main ring or subring has its own RPL.

In an ETHERNET ring without congestion, with all ETHERNET ring nodes in the idle state (i.e., no detected failure, no active automatic or external command and receiving only R-APS (NR, RB) messages) and with less than 1,200 km of ring fiber circumference and fewer than 16 ETHERNET ring nodes, the switch completion time (transfer time as defined in [ITU-T G.8032]) for a failure on a ring link should be less than 800 ms.

The ring protection architecture relies on the existence of an APS protocol to coordinate ring protection actions in an ETHERNET ring.

The switch supports up to two rings.

Guard Timer

All ring subscribers use a “Guard Timer.” It prevents a closed loop from forming and prevents ring subscribers from using outdated R-APS messages. The “Guard Timer” is enabled if a ring subscriber received information on a local switching request, such as after SF (“**Switch Fail**”), MS (“**Manual Switch**”) or FS (“**Forced Switch**”) commands. When the timer expires, the ring subscriber begins executing the actions it received from the R-APS. This timer cannot be stopped manually.

WTR Timer

The “WTR Timer” (“**Wait To Restore Timer**”) is used by the “RPL Owner.” The WTR timer applies to the revertive mode to prevent frequent triggering of the protection switching due to port flapping or intermittent signal failure defects. When the timer expires, the “RPL Owner” sends an R-APS (NR, RB) message through the ring.

WTB Timer

The “WTB Timer” (“**Wait To Block Timer**”) is enabled on the “RPL Owner.” The “RPL Owner” uses “WTB Timers” before initiating an RPL block and then reverting to the idle state after operator-initiated commands, such as for FS or MS conditions, are entered. Because multiple FS commands are allowed to co-exist in a ring, the “WTB Timer” ensures that clearing a single FS command does not trigger the re-blocking of the RPL. The “WTB Timer” should run five seconds longer than the “Guard Timer” – enough time to allow a reporting ring subscriber to receive two R-APS messages and to allow the ring to identify the latent state. When clearing a MS command, the “WTB Timer” prevents the formation of a closed loop, because the “RPL Owner” node does not respond to an outdated remote MS request during the recovery process.

Hold-off Timer

Each ring subscriber uses a “Hold-off Timer” to delay reporting a port failure. When the timer expires, the ring subscriber checks the port status. If the problem persists, a failure is reported. If the issue does not persist, nothing is reported.

ERPS Revertive and Non-Revertive Switching

ERPS uses revertive and non-revertive operation. In revertive operation, after the conditions causing a switch have cleared, the traffic channel is restored to the working transport entity, i.e., blocked on the RPL. After an error condition is cleared, the traffic channel is switched back only after expiration of a “WTR Timer” to prevent protecting states from toggling due to intermittent errors. Without revertive operation, the traffic channel continues to use RPL after a switch condition is cleared if the RPL has not failed.

Control VLAN

The “Control VLAN” is a domain in which only ERPS control packets are transmitted. Because no other packets are transmitted in the VLAN, there are no delays for the ERPS. Therefore, when configuring a control VLAN for a ring, make sure it is a new VLAN. The ERPS creates this control VLAN and its member ports automatically. The member port should have a left right port only.

In ERPS, control packets and data packets are separated in different VLANs. The control packets are transmitted in a control VLAN.

Instance

For ERPS Version 2, an instance is a profile that specifies a control VLAN and one or more data VLANs for the ERPS. The control and data packets in ERPS are separated in different VLANs. The control packets are transmitted in the control VLAN and the data packets in one or more data VLANs. In this way, a user can easily assign an instance to an ERPS ring.

If a port is blocked by the ERPS in ERPS Version 1, all packets are blocked.

If a port is blocked by an ERPS ring in ERPS Version 2, only the packets belonging to the VLANs in this instance are blocked.

Note

Control VLAN and Instance

In CLI or Web configurations, there are settings for the control VLAN and the instance. If the control VLAN is configured for a ring and an instance is to be configured for the ring, the control VLAN must be the same for the instance as that of the ring. Otherwise, an error is displayed. If you still want to use this instance, you can first change the control VLAN so that it is the same as that of the instance. You can then configure the instance.

Note

Function of the Ethernet Ring Protection Switching (ERPS)

Ethernet Ring Protection Switching (ERPS) feature implements protection switching mechanisms for Ethernet layer ring topologies. Only two sets of ring settings are allowed with a default WTR Timer of 300 s and Guard Timer of 500 ms. Global State enables and disables ERPS feature (max. 2 rings per switch, max. 16 switches per ring, switching time < 800 ms).

ERPS Setup

ERPS Setup

Note: Ethernet Ring Protection Switching (ERPS) feature implements protection switching mechanisms for Ethernet layer ring topologies. Only two sets of ring settings are allowed with a default WTR Timer of 300 sec and Guard Timer of 500 ms. Global State Enables and Disables ERPS feature.

ERPS Setup		
Parameter	Default	Description
Global State	<input checked="" type="checkbox"/>	<input type="checkbox"/> The "ERPS" function is not enabled for the switch.
		<input checked="" type="checkbox"/> The "ERPS" function is enabled for the switch.
Ring ID (*E.g.: Ring ID 155 (established between 1-255))		In the input field, enter the ring ID. Valid range: 1 ... 255 But in the Lean Managed Switches we support 2 rings.
Port State	Disable	Select "Disable" in the selection box to disable the state of the ring.
	Enable	Select "Enable" in the selection box to enable the state of the ring.
Ring Name		In the input field, enter the name of the ring (max. 32 characters). (e.g., Major Ring ID255)
Ring Type	Major-ring	Select "Major Ring" in the selection box if the switch should operate in the major ring.
	Sub-ring	Select "Subring" in the selection box if the switch should operate in the subring.
Control VLAN (1-4094)	1 ... 4094	In the input field, enter the VLAN ID that should serve as the domain for the ERPS control packets. Valid range: 1 ... 4094
Version	v2	Select "v2" in the selection box if you want to use Version 2 of the "ERPS" function.
	v1	Select "v1" in the selection box if you want to use Version 1 of the "ERPS" function.
MEL (0~7)	7	In the input field, enter the value for the "Control MEL" (M aintenance E ntity Group L evel) for the ring. The MEL specifies the priority. 0 = Lowest priority 7 = Highest priority
Left Port		The selection box is used to configure the left port and its type for the ring.
	None	Select "None" in the selection box if you do not want to select a port.
	1 ... 10	Select the corresponding port in the selection box.
	Normal	Select "Normal" in the selection box if the port is not assigned any specific function in the ERPS ring.
	Neighbor	Select "Neighbor" in the selection box if the neighboring port has the "Neighbor" function.
	Owner	Select "Owner" in the selection box if the port should take on the "Owner" function in the ERPS ring.
Right Port		This selection box is used to configure the right port and its type for the ring.
	None	Select "None" in the selection box if you do not want to select a port.
	1 ... 10	Select the corresponding port in the selection box.
	Normal	Select "Normal" in the selection box if the port is not assigned any specific function in the ERPS ring.
	Neighbor	Select "Neighbor" in the selection box if the neighboring port has the "Neighbor" function.
	Owner	Select "Owner" in the selection box if the port should take on the "Owner" function in the ERPS ring.

9.4.2 STP/RSTP

The (R)STP (“(R)apid Spanning Tree Protocol”) can detect and stop network loops, as well as provide “Backup Links” between switches, bridges or routers. It allows a switch to interact with other (R)STP-compliant switches in the network to ensure that only one path exists between any two stations on the network.

The switch supports both STP and RSTP as defined in the following standards:

- IEEE 802.1D Spanning Tree Protocol
- IEEE 802.1w Rapid Spanning Tree Protocol

The switch uses IEEE 802.1w RSTP, which allows faster convergence of the “Spanning Tree” than STP (the switch is also backwards-compatible with STP-only aware bridges). In RSTP, topology change information is directly propagated throughout the network from the device that generates the topology change. In STP, there are longer delays because the device that causes a topology change first notifies the “Root Bridge” and then the network. Both RSTP and STP remove unwanted learned addresses from the filtering database.

- In STP, the port states are Blocking, Listening, Learning and Forwarding.
- In RSTP, the port states are Discarding, Learning and Forwarding.

STP Switch Port States

- **“Blocking”**
If a port causes a “Switching Loop” (looping connection between two ports), user data can no longer be sent or received. However, the port can go into the “Forwarding” state if the other active connections fail and the “Spanning Tree” algorithm determines that the port may transition to that state. BPDU data is still received and sent in the “Blocking” state.
- **“Listening”**
The switch processes BPDUs and waits for possible new information that would cause it to return to the “Blocking” state.
- **“Learning”**
Even if the port does not yet forward any frames (packets), it can learn source addresses from frames received and add them to the filter database (“Switching Database”).
- **“Forwarding”**
The port is in normal operating mode and receives and sends data. STP still monitors incoming BPDUs that would indicate that the port should return to the “Blocking” state to prevent a loop.
- **“Disabled”**
It is not strictly part of the STP because a network administrator can manually disable a port.

RSTP Bridge Port Roles

- **“Root”**
The “Root Port” is a forwarding port that can best transmit data from the “Non-Root Bridge” to the “Root Bridge.”
- **“Designated”**
This is a forwarding port for every LAN segment.
- **“Alternate”**
This port represents an alternate path to the “Root Bridge.” However, the path is different than for the “Root Port.”
- **“Backup”**
This port is used as a backup/redundant path to a segment to which another “Bridge Port” is already connected.
- **“Disabled”**
This is not actually part of STP because a network administrator can manually disable a port.

Note

STP/RSTP

In this document, “STP” refers to both STP and RSTP.

STP Terminology

Root Bridge

The “Root Bridge” is the “base” (root) of the spanning tree.

Path Cost

The path costs are the costs for transmitting a frame through the port in the LAN. This value should be adjusted to the transmission speed.

The valid range is 1 to 200000000. A path with higher costs is more likely to be blocked by STP if a network loop is detected.

- **“Path Cost Short”** is the original size with a 16-bit value.
Only speeds up to 10 Gbit can be considered.
- **“Path Cost Long”** stands for a 32-bit value.
Speeds up to 10 Tbit are supported.

Table 63: STP Path Costs

Transmission Speed	Recommended Value	Recommended Range	Permissible Range
4 Mbit/s	250	100 ... 1000	1 ... 65535
10 Mbit/s	100	50 ... 600	1 ... 65535
16 Mbit/s	62	40 ... 400	1 ... 65535
100 Mbit/s	19	10 ... 60	1 ... 65535
1 Gbit/s	4	3 ... 10	1 ... 65535
10 Gbit/s	2	1 ... 5	1 ... 65535

- Each “Bridge” communicates with the “Root Bridge” via the “Root Port.” The “Root Port” is the port on the switch with the lowest path costs to the “Root Bridge” (the “Root Path Cost”). If there is no “Root Port,” then the switch becomes the “Root Bridge” for the “Spanning Tree” network.
- A “Designated Bridge” is selected for each LAN segment. This bridge has the lowest cost to the “Root Bridge” among the bridges connected to the LAN.

Forward Time (Forward Delay)

The “Forward Time” is the maximum time (in seconds) that the switch waits before it changes states. This delay is required because every switch must first receive information on topology changes before it forwards frames. In addition, each port needs time to receive information on conflicts that would make it return to the blocking state. Otherwise, temporary data loops might result. The valid range is 4 to 30 seconds.

Max Age

The “Max Age” is the maximum time (in seconds) that the switch can wait without receiving a BPDU (“**B**ridge **P**rotocol **D**ata **U**nit,” configuration message) before attempting to reconfigure. All switch ports (except for “Designated Ports”) receive BPDUs at regular intervals. Each port that ages out STP information (from the last BPDU) becomes the “Designated Port” for the attached LAN. If it is a “Root Port,” a new “Root Port” is selected from among the switch ports attached to the network.

Hello Time

The “Hello Time” is the time interval in seconds between configuration messages (BDPU “Bridge Protocol Data Unit”) sent from the root switch.

STP

After a bridge determines the lowest cost “Spanning Tree” with STP, it enables the “Root Port” and “Designated Ports” for connected LANs and disables all other ports that participate in STP. Network packets are therefore only forwarded between enabled ports, eliminating any possible network loops.

STP-aware switches exchange BPDUs periodically. If the topology changes in a LAN coupled via bridge, a new tree is spanned. Once a stable network topology has been established, all bridges listen for “Hello BPDUs” transmitted from the “Root Bridge.” If a bridge does not get a “Hello BPDU” after a predefined interval (“Max Age”), the bridge assumes that the link to the “Root Bridge” is down. This bridge then initiates negotiations with other bridges to reconfigure the network to re-establish a valid network topology.

Edge Port

“Edge Ports” are attached to a LAN that has no other bridges attached. These ports can transition directly to the “Forwarding” state. RSTP still continues to monitor the port for BPDUs in case a bridge is connected. RSTP can also be configured to automatically detect “Edge Ports.” As soon as the bridge detects a BPDU coming to an “Edge Port,” the port loses its status as an “Edge Port.”

Forward Delay

The “Forward Delay” is the maximum time (in seconds) that the root device waits before changing states (e.g., from “Listening” to “Learning” to “Forwarding”). The valid range is from 4 to 30 seconds.

Transmission Limit

The “Transmission Limit” is used to configure the minimum interval between the transmissions of consecutive RSTP BPDUs. This function can only be enabled in RSTP mode. The valid range is from 1 to 10 seconds.

Bridge Priority

“Bridge Priority” is used in selecting the root switch, root port and “Designated Port.” The switch with the highest priority becomes the STA root switch. If all switches have the same priority, however, the switch with the lowest MAC address becomes the root switch.

Port Priority

The port priority is configured in the switch. A low numeric value indicates a high priority. A port with lower priority is more likely to be blocked by STP if a network loop is detected. The valid range is from 0 to 240.

BPDU Guard

This setting is configured separately for each port. If the port is enabled in “BDU Guard” and receives a BPDU, the port is switched to the “Disabled” state to prevent a faulty environment. The user must enable the port manually.

BPDU Filter

This function is used to set up a filter for sending or receiving BPDUs on a switch port. If the port receives BPDUs, the BPDUs are dropped. If both the “BPDU Filter” and the “BPDU Guard” are enabled, the “BPDU Filter” has the higher priority.

Note

BPDU Filter and BPDU Guard

If both the “BPDU Filter” and the “BPDU Guard” are enabled, the “BPDU Filter” has the higher priority.

Root Guard

The “Root Guard” function forces an interface to become a “Designated Port” to prevent neighboring switches from becoming a root switch. This function provides a way to specify the selection of a “Root Bridge” in a network. It prevents a “Designated Port” from becoming the “Root Port.” If a port with the “Root Guard” function receives a superior BPDU, the port moves to a root-inconsistent state (effectively equivalent to the “Listening” state) to maintain the status of the current “Root Bridge.” The port can be moved to the “Forwarding” state if it receives no superior BPDU for the time period of “Hello Times.”

9.4.2.1 STP/RSTP Setup

Note

Functions of the STP/RSTP

STP/RSTP detects and breaks network loops provides backup links between switches, bridges or routers.

Default values: Forward Delay 15 s, Max Age 20 s and Hello Time 2 s.

9.5.1.3 Traffic Flooding

A traffic flooding means that your network is over whelmed with constant broadcast or multicast traffic. Broadcast traffic flooding can eventually lead to a complete loss of network connectivity as the packets proliferate.

Traffic flooding Control protects the Switch bandwidth from flooding packets, including broadcast packets, multicast packets, and destination lookup failure (DLF). The Rate is a threshold that limits the total number of the selected type of packets. For example, if the broadcast and multicast options are selected, the total amount of packets per second for those two types will not exceed the limit value.

Broadcast traffic flooding control limits the number of broadcast, multicast and unknown unicast (also referred to as Destination Lookup Failure or DLF) packets the Switch receives per second on the ports. When the maximum number of allowable broadcast, multicast and unknown unicast packets is reached per second, the subsequent packets are discarded. Enable this feature to reduce broadcast, multicast and unknown unicast packets in your network.

Traffic flooding Control unit: 3700 packets per second.

Default Settings

Broadcast Storm Control:	100 packets per second
Multicast Storm Control	None
DLF Storm Control	100 packets per second

Note

Set an alarm threshold

9.5.2 Dashboard Configuration

9.5.2.1 Quick Diagnosis Dashboard

9.5.2.1.1 Port Registration Learn

Quick Diagnosis Dashboard

Figure 86: Tab "Diagnostic" – Menu "Dashboard Configuration" – "Port Registration Learn"

Click the **[Learn]** button to save configuration of the port settings.

If the connection of the individual participants to the network is correctly connected, the current connection state is saved in the switch as a reference. Deviations from this state will be displayed as errors in the dashboard or topology map in the future.

Click the **[Reset]** button to reset to default configuration (learned register ports are forget).

Note

Learning the neighboring devices

Enable LLDP on the neighboring devices. Alternatively, you can learn the neighboring devices using the MAC address. (see Section "Configuration" ...> ... "Manual Registration").

9.5.2.1.2 Port Link Down Statistics

Port Link Down Statistics ^

Press "Reset" to reset the port link down statistics.

All v

Reset

Press "Download" to download the port link down statistics log.

Download

Figure 87: Tab "Diagnostic" – Menu "Dashboard Configuration" – "Port Link Down Statistics"

In this menu, user can select particular interface or all statistics, user can reset or download.

Click the **[Reset]** button to reset the port link down statistics. This will delete the values from the diagnostic dashboard.

Click the **[Download]** button to download the port link down statistics log. This file can be used to locate loose contacts in the ETHERNET network.

9.5.2.1.3 Critical/Alert Threshold

Here you can set the thresholds at which the tiles "CPU Usage", "Memory Usage", "Transmitting Port Usage" and "Receiving Port Usage" change colors in the dashboard (see Section "Diagnostics").

Note

Functions of the threshold values

The Alert Threshold controls at which value the tiles turns yellow and the Critical Threshold controls at which value the tiles turns red. These thresholds can be set individually for CPU, memory and port send (Tx) / receive (Rx) utilization.

9.5.3 Modbus

9.5.3.1 Data Format and Function Code

MODBUS TCP supports different types of data formats for reading. The four most important types are:

Table 70: Data Format and Function Code

Data Access Type		Function Code	Function Name	Note
Bit access	Physical Discrete Inputs	2	Read Discrete Inputs	Not supported.
	Internal Bits or Physical Coils	1	Read Coils	Not supported.
Word access (16-bit access)	Physical Input Registers	4	Read Input Registers	
	Physical Output	3	Read Holding Registers	Not supported.

9.5.3.2 MODBUS Register

Modbus

Figure 90: Tab "Diagnostic" – Menu "Modbus"

Table 71: Modbus

Modbus TCP Settings		
Parameter	Default	Description
Enabled State	<input type="checkbox"/>	<input type="checkbox"/> Function „Modbus“ is disable.
		<input checked="" type="checkbox"/> Function „Modbus“ is enable.

Note

Modbus/TCP Tables

The table „Modbus/TCP Tables“ can be found in section “Appendix” > “Modbus/TCP Tables”.

The Modbus registers are also displayed in the WBM.

9.5.4 SNMP

Note

**Change to the "Configuration" menu**

If you click the "SNMP" menu in the "Diagnostic" tab, you can access the "Configuration" tab in the "SNMP" menu.

Refer to the "Configuration" > "SNMP" section for a detailed description.

9.5.5 System Log

9.5.5.1 Syslog Server Setting

The syslog function can be enabled or disabled. The default setting is disabled. The log message is recorded in the Switch file system. If the syslog server's IP address has been configured, the Switch will send a copy to the syslog server.

Note

Limit of the log message file

The log message file is limited in 4 kB size. If the file is full, the oldest one will be replaced.

Note

Syslog function

The syslog function records some of system information for debugging purpose. Each log message recorded with one of these levels, Alert/Critical/Error/Warning/Notice/Information.

Figure 91: Tab "Diagnostic" – Menu "System Log"

Table 72: Tab "Diagnostic" – Menu "System Log"

Syslog Server Settings		
Parameter	Default	Description
Global State	<input type="checkbox"/>	<input type="checkbox"/> Global State is disable.
		<input checked="" type="checkbox"/> Global State is enable.
Server IP	0.0.0.0	Enter the IP address in decimal-point notation (e.g., 192.168.1.1).
System Log		
Parameter	Default	Description
Log Level	All	Select "All" in the selection box if you want to display all log messages.
	1:Alarm	Select "Alarm" in the selection box if you want to display the log messages.
	2:Critical	Select "Critical" in the selection box if you want to display critical log messages.
	3:Error	Select "Error" in the selection box if you want to display the errors.
	4:Warning	Select "Warning" in the selection box if you want to display the warnings.
	5:Notice	Select "Notice" in the selection box if you want to display the notices.
	6:Information	Select "Information" in the selection box if you want to display all information.

9.6 Maintenance

9.6.1 Reboot

Note

Function of Maintenance

Maintenance option to reboot, configuration backup/restore, firmware upgrade, reset the switch to default.

Maintenance

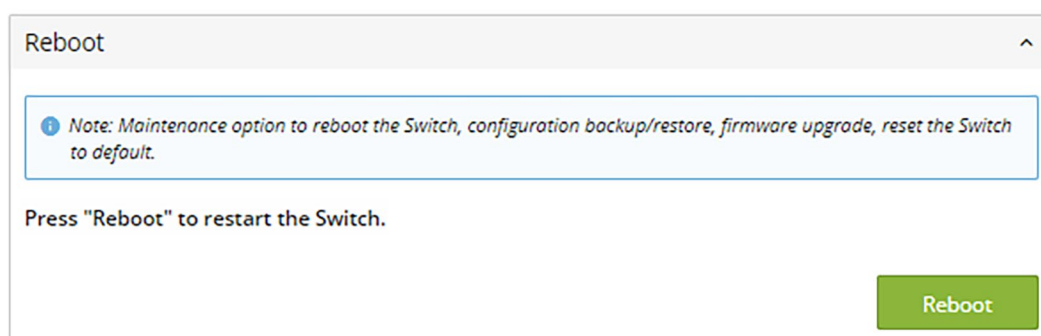

Figure 92: Tab “Maintenance” – Menu “Maintenance” – “Reboot”

The “Reboot” function allows you to restart the switch without physically turning the power off.

Follow the steps below to reboot the switch.

1. Click the **[Reboot]** button in the “Reboot” menu. The following windows open:

Figure 93: Tab “Maintenance” – “Reboot” Tab – Message

2. Click **[OK]** and wait for the switch to restart. The process can take up to two minutes. This process does not change the switch configuration.

9.6.2 Upgrade Firmware

The screenshot shows a web interface for upgrading firmware. It has a title bar labeled 'Upgrade Firmware' with a small upward-pointing arrow on the right. Below the title bar, there is a label 'File Path' followed by a text input field that contains the placeholder text 'Choose file...'. At the bottom right of the interface is a button labeled 'Upload'.

Figure 94: Tab “Maintenance” – Menu “Maintenance” – “Upgrade Firmware”

Execute the following steps to update the switch’s firmware.

1. Click the **[Choose file]** button.
The file selection dialog opens. Select the respective firmware file.
2. Click the **[Upgrade]** button to load the new firmware.

9.6.3 Upload Configuration

Figure 95: Tab “Maintenance” – Menu “Maintenance” – “Upload Configuration”

Execute the following steps to upload the configuration file from your PC to the switch.

1. Select “Upload configuration file to your Switch.”
2. Click the **[Choose file]** button.
Select the configuration file by specifying the full path.
3. Click the **[Upload]** button to begin uploading the file.

Note

Modification of the configuration file

By modifying the configuration file with a text editor a higher number of switches can be configured quickly.

9.6.4 Download Configuration

Figure 96: Tab "Maintenance" – Menu "Maintenance" – "Download Configuration"

Execute the following steps to save the configuration file to your PC.

1. Select "Press Download to save the configuration file to your PC."
2. Click the **[Download]** button to start the download.

9.6.5 Reset Configuration

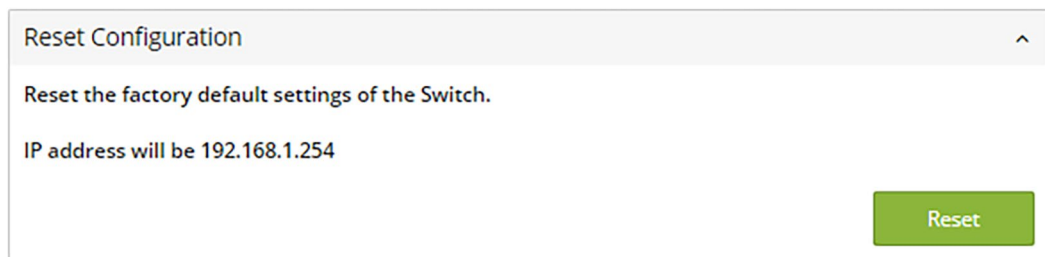

Figure 97: Tab "Maintenance" – Menu "Maintenance" – "Reset Configuration"

The "Reset Configuration" function resets the switch to the factory settings.

Follow the steps below to reset the switch.

1. Click the **[Reset]** button in the "Reset" menu. The following windows open:

Figure 98: Tab "Maintenance" – "Reset" Tab – Message

2. Click **[OK]** and wait for the switch to restart. The process can take up to two minutes. This system configuration reset to default values.

10 Appendix

10.1 RJ-45 Cable

Always use category 5e cables to connect your network devices. The pin assignment is given below:

Table 73: RJ-45 Cable

Contact	Description		Pair	Color (acc. EIA/TIA 568B)
	4-wire	8-wire		
1	TD	D1+	2	White/Orange
2	TD-	D1-	2	Orange
3	RX+	D2+	3	White/Green
4	Not assigned	D3+	1	Blue
5	Not assigned	D3-	1	White/Blue
6	RX-	D2-	3	Green
7	Not assigned	D4+	4	White/Brown
8	Not assigned	D4-	4	Brown

Note

Functions on the RJ45 connector

The Lean Managed Switch offers the functions autocrossing und autonegotiation to the RJ-45 connection.

10.2 Configuring in the Command Line Interface (CLI)

To configure the switch via CLI, a Telnet or SSH connection to the switch is required.

This chapter lists a selection of available Command Line Interface commands.

10.2.1 System Status

10.2.1.1 System Information

Table 74: CLI "System Information" Configuration

Node	Command	Description
enable	show hostname	This command displays the system's network name.
configure	reboot	This command reboots the system.
eth0	ip address A.B.C.D/M	This command configures the static IP and subnet mask for the system.
interface	show	This command displays the current port configuration.
acl	show	This command displays the current access control list.
vlan	show	This command displays the current VLAN configuration.
enable	show interface eth0	This command displays the current Eth0 configurations.
enable	show model	This command displays the system information.
enable	show running-config	This command displays the current operating configurations.
enable	show system-info	This command displays the system's CPU utilization and memory information.
enable	show uptime	This command displays the system uptime.

10.2.2 Default Settings

10.2.2.1 System

Table 75: CLI "System" Configuration

Node	Command	Description
enable	ping IPADDR [-c COUNT]	This command sends an echo request to the destination host. The -c parameter allow user to specific the packet count. The default count is 4.
enable	ping IPADDR [-s SIZE]	This command sends an echo request to the destination host. The -s parameter allow user to specific the packet size. Valid range: 0 ... 1047 bytes
enable	ping IPADDR [-c COUNT -s SIZE]	This command sends an echo request to the destination host. The -c parameter allow user to specific the packet count. The default count is 4. The -s parameter allow user to specific the packet size. Valid range: 0 ... 1047 bytes
enable	ping IPADDR [-s SIZE -c COUNT]	This command sends an echo request to the destination host. The -c parameter allow user to specific the packet count. The default count is 4. The -s parameter allow user to specific the packet size. Valid range: 0 ... 1047 bytes
configure	Reboot	This command reboots the system.
configure	hostname STRINGS	This command sets the system's network name.
configure	interface eth0	This command enters the eth0 interface node to configure the system IP.
configure	configure terminal	This command enter the configuration mode.
configure	interface eth0	This command enter the configuration mode of the interface.
eth0	Show	This command show information about eth0.
eth0	ip address A.B.C.D/M	This command sends an echo request to the destination host. The -c parameter allow user to specific the packet count. The default count is 4. The -s parameter allow user to specific the packet size. Valid range: 0 ... 1047 bytes
eth0	ip address default-gateway A.B.C.D	This command configures the system's default gateway.
eth0	ip dhcp client (disable enable renew)	This command configures a DHCP client function for the system. "Disable": Use a static IP address for the switch. "Enable & Renew": Use the DHCP client to get an IP address from the DHCP server.
eth0	management vlan VLAN_ID	This command configures the management VLAN.

10.2.2.2 Jumbo Frame

Table 76: CLI “Jumbo Frame” Configuration

Node	Command	Description
enable	show jumboframe	This command displays the current jumbo frame settings.
configure	jumboframe (10240 1522 1536 1552 9216)	This command configures the maximum number of bytes for frame sizes.
configure	interface IFNAME	This command starts configuration mode.
interface	jumboframe(10240 1522 1536 1552 9010 9216)	This command configures the maximum number of bytes per frame.
configure	interface range gigabitethernet1/0/PORTLISTS	This command starts configuration mode.
if-range	jumboframe(10240 1522 1536 1552 9010 9216)	This command configures the maximum number of bytes per frame.

10.2.2.3 SNTP

Table 77: CLI "SNTP" Configuration

Node	Command	Description
enable	show time	This command displays the current time and date configuration.
configure	time HOUR:MINUTE:SECOND	This command sets the current time of the switch. hour: 0 ... 23 min: 0 ... 59 sec: 0 ... 59 Note: If you do not configure daylight saving time until after the date and time, the switch uses daylight saving time.
configure	time date YEAR/MONTH/DAY	This command sets the current date of the switch. year: 1970– month: 1 ... 12 day: 1 ... 31
configure	time daylight-saving-time	This command enables daylight saving time.
configure	no time daylight-saving-time	This command disables daylight saving time on the switch.
configure	time daylight-saving-time start-date (first second third fourth last) (Sunday Monday Tuesday Wednesday Thursday Friday Saturday) MONTH HOUR	This command sets the start date of daylight saving time.
configure	time daylight-saving-time end-date (first second third fourth last) (Sunday Monday Tuesday Wednesday Thursday Friday Saturday) MONTH HOUR	This command sets the end date of daylight saving time.
configure	time ntp-server (disable enable)	This command disables/enables the NTP server settings.
configure	time ntp-server IP_ADDRESS	This command sets the IP address of the time server.
configure	time ntp-server domain-name STRING	This command sets the domain names of the time server.
configure	time timezone STRING	This command sets the time difference between UTC (formerly GMT) and the time zone. Valid range: –1200 ... +1200

Example

```
L2SWITCH(config)#time ntp-server 192.5.41.41
```

```
L2SWITCH(config)#time timezone +0800
```

```
L2SWITCH(config)#time ntp-server enable
```

```
L2SWITCH(config)#time daylight-saving-time start-date first Monday 6 0
```

```
L2SWITCH(config)#time daylight-saving-time end-date last Saturday 10 0
```

10.2.2.4 Management Host

Table 78: CLI "Management Host" Configuration

Node	Command	Description
enable	show interface eth0	The command displays all eth0 interface configurations.
eth0	Show	The command displays all eth0 interface configurations.
eth0	management host A.B.C.D	The command adds a management host address.
eth0	no management host A.B.C.D	The command deletes a management host address.

Example

```
L2SWITCH#configure terminal
```

```
L2SWITCH(config)#interface eth0
```

```
L2SWITCH(config-if)#management host 192.168.200.106
```

10.2.2.5 MAC Management

Table 79: CLI “MAC Management” Configuration

Node	Command	Description
enable	show mac-address-table aging-time	This command displays the current “Age Time” for the MAC address table.
enable	show mac-address-table (static dynamic)	This command displays the current static/dynamic unicast address entries.
enable	show mac-address-table mac MACADDR	This command displays information on a specific MAC address table.
enable	show mac-address-table port PORT_ID	This command displays the current unicast address entries recognized by the specific port.
configure	mac-address-table static MACADDR vlan VLANID port PORT_ID	This command configures a static unicast entry.
configure	no mac-address-table static MACADDR vlan VLANID	This command deletes a static unicast entry from the address table.
configure	mac-address-table aging-time VALUE	This command configures the MAC table “Age Time.”
configure	clear mac address-table dynamic	This command deletes the dynamic address entries.

Example

L2SWITCH(config)#*mac-address-table static 00:11:22:33:44:55 vlan 1 port 1*

10.2.2.6 Port Mirroring

Table 80: CLI “Port Mirroring” Configuration

Node	Command	Description
enable	show mirror	This command displays the current “Port Mirroring” configurations.
configure	mirror (disable enable)	This command disables/enables “Port Mirroring” on the switch.
configure	mirror destination port PORT_ID	This command specifies the monitor port for the “Port Mirroring.”
configure	mirror source ports PORT_LIST mode (both ingress egress)	This command adds a port or port range as the source port(s) for the “Port Mirroring.”
configure	no mirror source ports PORT_LIST	This command removes a port or port range as the source port(s) for the “Port Mirroring.”

Example

L2SWITCH#*configure terminal*

L2SWITCH(config)#*mirror enable*

L2SWITCH(config)#*mirror destination port 2*

L2SWITCH(config)#*mirror source ports 3-11 mode both*

10.2.2.7 Port Settings

Table 81: CLI “Port Settings” Configuration

Node	Command	Description
enable	show interface IFNAME	This command displays the current port configurations.
configure	interface IFNAME	This command is used to enter the “interface configure node.”
interface	Show	This command displays the current port configurations.
interface	flowcontrol (off on)	This command disables/enables “Flow Control” for a port.
interface	speed (auto 10-full 10-full-n 10-half 10-half-n 100-full 100-full -n 100-half 100-half-n 1000-full 1000-full-n)	This command configures the speed and duplex mode for a port.
interface	shutdown	This command disables a specific port.
interface	no shutdown	This command enables a specific port.
interface	description STRINGs	This command configures a description for the respective port.
interface	no description	This command is used to configure the standard description of the port.
configure	interface range gigabitethernet1/0/PORTLI STS	This command is used to enter the interface configure node.
if-range	description STRINGs	This command configures a description for the specific port.
if-range	no description	This command is used to configure the standard port description for the individual ports.
if-range	shutdown	This command disables specific ports.
if-range	no shutdown	This command enables specific ports.
if-range	speed (auto 10-full 10-full-n 10-half 10-half-n 100-full 100-full -n 100-half 100-half-n 1000-full 1000-full-n)	This command configures the speed and duplex for the port.

Example

```
L2SWITCH#configure terminal
```

```
L2SWITCH(config)#interface fa1/0/1
```

```
L2SWITCH(config-if)#speed auto
```

10.2.3 Advanced Settings

10.2.3.1 Power over Ethernet (PoE)

Table 82: CLI "PoE Settings" Configuration

Node	Command	Description
enable	show poe	This command displays the PoE configurations and status.
configure	poe (disable enable)	This command disables or enables the global PoE for the Switch.
configure	poe total-power	This command configures the total power which the Switch can support.
interface	poe(disable enable)	This command enables or disables the PoE function on the specific port.
if-range	poe (disable enable)	This command disables / enables the PoE on a port or a range of ports.

10.2.3.2 PD Alive Check

Table 83: CLI “PD Alive Check” Configuration

Node	Command	Description
enable	show pd-alive	This command displays the configuration of the PD Alive Check.
configure	pd-alive (disable enable)	This command disables or enables the global PD Alive Check on the Switch.
Interface	pd-alive (disable enable)	This command disables or enables the PD Alive Check on the interface.
Interface	pd-alive action (all alarm none reboot)	<p>This command configures the action when the system detects that the host cannot respond the keep-a-live probe packet.</p> <p>All: Send an alarm message to inform the administrator and then reboot the PD.</p> <p>Alarm: Send an alarm message to inform the administrator.</p> <p>None: Keep Ping the remote PD but does nothing further.</p> <p>Reboot: Cut off the power of the PoE port, make the PD rebooted..</p>
Interface	pd-alive interval VALUE	This command configures the interval to send the keep-a-live probe packets to check if the host is still alive for the specific port.
Interface	pd-alive ip IP_ADDR	This command configures the Host IP address which connects to the specific port.
Interface	pd-alive power-off-time VALUE startup-time VALUE	This command configures the power-off time and startup time.
Interface	pd-alive retry-time VALUE	This command configures the retry times when no response from the host for the keep-a-live probe packet for the specific port.
enable	show snmp	This command displays the SNMP configurations.
configure	snmp (disable enable)	This command disables/enables the SNMP on the switch.
configure	snmp community STRING (ro rw) trusted-host IPADDR	This command configures the SNMP community name.
configure	no snmp community	This command restores the snmp community to default.
configure	snmp system-contact STRING	This command configures contact information for the system.
configure	no snmp system-contact STRING	This command restores the system contact to default.
configure	snmp system-location STRING	This command configures the location information for the system.
configure	no snmp system-location STRING	This command restores the system location to default.
configure	snmp system-name STRING	This command configures a name for the system. (The System Name is same as the host name, (up to 64 characters))
configure	no snmp system-name STRING	This command restores the system name string to default.

Table 83: CLI "PD Alive Check" Configuration

Node	Command	Description
configure	snmp trap-receiver IPADDR VERSION COMMUNITY	This command configures the trap receiver's configurations, including the IP address, version (v1 or v2c) and community.
configure	no snmp trap-receiver IPADDR	This command deletes the trap receiver's configurations.

10.2.3.3 Storm Control

Table 84: CLI "Storm Control" Configuration

Node	Command	Description
enable	show storm-control	This command displays the current "Storm Control" configurations.
configure	storm-control rate RATE_LIMIT type (bcast mcast DLF bcast+mcast bcast+DLF mcast+DLF bcast+mcast+DLF) ports PORTLISTS	This command enables bandwidth limitation for broadcast, multicast or DLF packets and sets it for a specified type.
configure	no storm-control type (bcast mcast DLF bcast+mcast bcast+DLF mcast+DLF bcast+mcast+DLF) ports PORTLISTS	This command disables bandwidth limitation for broadcast, multicast or DLF packets.

Example

L2SWITCH#*configure terminal*

L2SWITCH(config)#*storm-control rate 1 type broadcast ports 1-6*

L2SWITCH(config)#*storm-control rate 1 type multicast ports 1-6*

L2SWITCH(config)#*storm-control rate 1 type DLF ports 1-6*

10.2.3.4 VLAN

10.2.3.4.1 Port Isolation

Table 85: CLI "Port Isolation" Configuration

Node	Command	Description
enable	show port-isolation	This command displays the current "Port Isolation" configurations. "V" indicates that the port's packets can be sent to this port. "-" indicates that the port's packets cannot be sent to this port.
interface	port-isolation ports PORTLISTS	This command configures a port or port range to forward data packets from a specific port.
interface	no port-isolation	This command configures all ports to forward data packets from a specific port.

Example

```
L2SWITCH(config)#interface 1/0/2
```

```
L2SWITCH(config-if)#port-isolation ports 3-10
```

10.2.3.4.2 VLAN Settings

Table 86: CLI "VLAN Settings" Configuration

Node	Command	Description
enable	show vlan VLANID	This command displays the VLAN configurations.
configure	vlan <1–4094>	This command enables a VLAN and enters the VLAN node.
configure	no vlan <1–4094>	This command deletes a VLAN.
vlan	show	This command displays the current VLAN configurations.
vlan	name STRING	This command assigns a name to the specific VLAN. The VLAN name should be a combination of numbers, letters, hyphens (-) and underscores (_). The maximum length of the name is 16 characters.
vlan	no name	This command resets the VLAN name to the default setting. Note: The default VLAN name comprises the following: : "VLAN"+VLAN_ID, VLAN1, VLAN2, ...
vlan	fixed PORT_LIST	This command assigns ports to a VLAN group as fixed subscribers.
vlan	no fixed	This command deletes all fixed ports from a VLAN.
vlan	tagged PORT_LIST	This command assigns fixed ports to a VLAN group as tagged subscribers. The port(s) should be a fixed subscriber of the VLAN group.
vlan	no tagged	This command deletes all tagged fixed ports from a VLAN.
vlan	untagged PORT_LIST	This command assigns fixed ports to a VLAN group as untagged subscribers. The port(s) should be a fixed subscriber of the VLAN group.
vlan	no untagged	This command deletes all untagged ports from a VLAN.
vlan	acceptable frame type (all tagged untagged)	This command configures the permissible frame type.

Example

L2SWITCH#*configure terminal*

L2SWITCH(config)#*vlan 2*

L2SWITCH(config-vlan)#*fixed 1-6*

L2SWITCH(config-vlan)#*untagged 1-3*

10.2.3.5 LLDP

Table 87: CLI “LLDP” Configuration

Node	Command	Description
enable	show lldp	This command displays the LLDP configurations.
enable	show lldp neighbor	This command displays all information of port neighbors.
configure	lldp (disable enable)	This command globally enables/disables the LLDP function on the switch.
configure	lldp tx-hold <2-100>	This command configures the “tx-Hold Time” that determines the TTL of the switch message (TTL = tx-hold * tx-interval).
interface	lldp tx-interval <1-3600>	This command configures the interval to transmit the LLDP packets.

10.2.3.6 Loop Detection

Table 88: CLI “Loop Detection” Configuration

Node	Command	Description
enable	show loop-detection	This command displays the current configuration for “Loop Detection.”
configure	loop-detection (disable enable)	This command disables/enables “Loop Detection” on the switch.
configure	loop-detection address MACADDR	This command configures the destination MAC address for special “Loop Detection” packets.
configure	no loop-detection address	This command resets the destination MAC address to the default setting (00:0b:04:AA:AA:AB).
interface	loop-detection (disable enable)	This command disables/enables “Loop Detection” for a specific port.
interface	no shutdown	This command enables a specific port. The command can enable a port blocked by “Loop Detection.”
interface	loop-detection recovery (disable enable)	This command enables/disables the “Recovery” function on a port.
interface	loop-detection recovery time VALUE	This command configures the “Recovery Time” period.

Example

L2SWITCH(config)#*loop-detection enable*

L2SWITCH(config)#*interface 1/0/1*

L2SWITCH(config-if)#*loop-detection enable*

L2SWITCH(config-if)#*loop-detection recovery enable*

L2SWITCH(config-if)#*loop-detection recovery time 10*

10.2.3.7 STP

Table 89: CLI “STP” Configuration

Node	Command	Description
enable	show spanning-tree active	This command only displays STP information for active ports.
enable	show spanning-tree blockedports	This command only displays STP information for blocked ports.
enable	show spanning-tree port detail PORT_ID	This command displays STP information for the interface port.
enable	show spanning-tree statistics PORT_ID	This command displays STP information for the interface port.
enable	show spanning-tree summary	This command displays a summary of port states and configurations.
enable	clear spanning-tree counters	This command clears the STP statistics for all ports.
enable	clear spanning-tree counters PORT_ID	This command clears the STP statistics for a specific port.
configure	spanning-tree (disable enable)	This command disables/enables the STP function in the system.
configure	spanning-tree algorithm-timer forward-time TIME max-age TIME hello-time TIME	This command configures the bridge times (“Forward Delay,” “Max Age” and “Hello Time”).
configure	no spanning-tree algorithm-timer	This command configures the default values for “Forward Delay,” “Max Age” and “Hello Time.”
configure	spanning-tree forward-time <4–30>	This command configures the “Forward Delay” period (in seconds) for the bridge.
configure	no spanning-tree forward-time	This command configures the default values for “Forward Delay.”
configure	spanning-tree hello-time <1–10>	This command configures the “Hello Time” period (in seconds) for the bridge.
configure	no spanning-tree hello-time	This command configures the default values for the “Hello Time.”
configure	spanning-tree max-age <6–40>	This command configures the “Max Age” period (in seconds) for bridge messages.
configure	no spanning-tree max-age	This command configures the default values for the “Max Age.”
configure	spanning-tree mode (rstp stp)	This command configures the STP mode.
configure	spanning-tree pathcost method (short long)	This command configures the path cost method.
configure	spanning-tree priority <0–61440>	This command configures the priority for the system.
configure	no spanning-tree priority	This command configures the default values for the system priority.
interface	spanning-tree bpdupfilter (disable enable)	This command configures enables/disables the “BPDU Filter” function.
interface	spanning-tree bpduguard (disable enable)	This command configures enables/disables the “BPDU Guard” function.
interface	spanning-tree edge-port (disable enable)	This command enables/disables the “Edge Port” setting.

Table 89: CLI "STP" Configuration

Node	Command	Description
interface	spanning-tree cost VALUE	This command configures the costs for the specific port. Cost range: 16-bit-based value range from 1 to 65,535, 32-bit-based value range from 1 to 200,000,000.
interface	no spanning-tree cost	This command sets the path cost of the specific port to the default value.
interface	spanning-tree port-priority <0-240>	This command configures the priority for the specific port (default value: 128).
interface	no spanning-tree port-priority	This command sets the priority of the specific port to the default value.

10.2.4 Security

10.2.4.1 Access Control List

Table 90: CLI "Access Control List" Configuration

Node	Command	Description
enable	show access-list	This command displays all access control profiles.
configure	access-list STRING	This command creates a new access control profile, where "STRING" is the profile name.
configure	no access-list STRING	This command deletes an access control profile.
acl	show	This command displays the current access control profile.
acl	action (disable drop permit)	This command processes the profile. "disable": The profile is disabled. "drop": If packets match the profile, they are dropped. "permit": If packets match the profile, they are forwarded.
acl	destination mac host MACADDR	This command configures the destination MAC address and the mask for the profile.
acl	destination mac MACADDR	This command configures the destination MAC address and the mask for the profile.
acl	destination mac MACADDR MACADDR	This command configures the destination MAC address and the mask for the profile. The second "MACADDR" parameter is the mask (e.g., ffff.ffff.0000) for the profile.
acl	no destination mac	This command deletes the destination MAC address from the profile.
acl	ethertype STRING	This command configures the ETHERNET type for the profile, where the "STRING" is a hexadecimal value, e.g., 08AA.
acl	no ethertype	This command deletes the ETHERNET type limit from the profile.
acl	source mac host MACADDR	This command configures the source MAC address and the mask for the profile.
acl	source mac MACADDR MACADDR	This command configures the source MAC address and the mask for the profile.
acl	no source mac	This command deletes the source MAC and the mask from the profile.
acl	source ip host IPADDR	This command configures the source IP address for the profile.
acl	source ip IPADDR IPMASK	This command configures the source IP address and the mask for the profile.
acl	no source ip	This command deletes the source IP address from the profile.
acl	destination ip host IPADDR	This command configures a specific destination IP address for the profile.
acl	destination ip IPADDR IPMASK	This command configures the destination IP address and the mask for the profile.
acl	no destination ip	This command deletes the destination IP address from the profile.

10.2.5 Monitor

10.2.5.1 Alarm

Table 91: CLI "Alarm" Configuration

Node	Command	Description
enable	show alarm-info	This command displays alarm information.

10.2.5.2 Monitor Information

Table 92: CLI "Monitor Information" Configuration

Node	Command	Description
enable	show hardware-monitor (C F)	This command displays hardware operation information.

10.2.5.3 SFP Information

Table 93: CLI "SFP Information" Configuration

Node	Command	Description
enable	show sfp info port PORT_ID	This command displays the SFP information.
enable	show sfp ddmi port PORT_ID	This command displays the SFP DDMI status.

10.2.6 Management

10.2.6.1 SNMP

Table 94: CLI "SNMP" Configuration

Node	Command	Description
enable	show snmp	This command displays the SNMP configurations.
configure	snmp community STRING (ro rw) trusted-host IPADDR	This command configures the "SNMP Community" name.
configure	snmp (disable enable)	This command disables/enables SNMP on the switch.
configure	snmp system-contact STRING	This command configures contact information for the system.
configure	snmp system-location STRING	This command configures the location information for the system.
configure	snmp system-name STRING	This command assigns a name to the system.
configure	snmp trap-receiver IPADDR VERSION COMMUNITY	This command sets up the trap receiver's configurations, including the IP address, version (v1 or v2c) and "Community."

Example

```
L2SWITCH#configure terminal
```

```
L2SWITCH(config)#snmp enable
```

```
L2SWITCH(config)#snmp community public rw trusted-host 192.168.200.106/24
```

```
L2SWITCH(config)#snmp trap-receiver 192.168.200.106 v2c public
```

```
L2SWITCH(config)#snmp system-contact IT engineer
```

```
L2SWITCH(config)#snmp system-location Wago
```

10.2.6.2 Maintenance

Table 95: CLI “Maintenance” Configuration

Node	Command	Description
configure	reboot	This command reboots the system.
configure	reload default-config	This command resets the system configuration to the default settings. Note: The system automatically reboots to apply the configurations.
configure	write memory	This command writes the current operating configurations to the configuration file.
configure	archive download-config <URL PATH>	This command downloads an updated configuration file from the TFTP server, where <URL PATH> can be: ftp://user:pass@192.168.1.1/file http://192.168.1.1/file tftp://192.168.1.1/file
configure	archive upload-config <URL PATH>	This command uploads the current configurations file to the TFTP server.
configure	archive download-fw <URL PATH>	This command downloads an updated firmware file from the TFTP server, where <URL PATH> can be: ftp://user:pass@192.168.1.1/file http://192.168.1.1/file tftp://192.168.1.1/file

10.2.6.3 System Log

Table 96: CLI “System Log” Configuration

Node	Command	Description
enable	show syslog	The command displays all log messages recorded in the switch.
enable	show syslog level <1-6>	This command displays the log messages with the “LEVEL” recorded in the switch.
enable	show syslog server	The command displays the syslog server configurations.
configure	syslog (disable enable)	The command disables/enables the syslog function.
configure	clear syslog	The command clears the syslog message.

Example

L2SWITCH#*configure terminal*

L2SWITCH(config)#*syslog-server ip 192.168.200.106*

L2SWITCH(config)#*syslog-server enable*

10.2.6.4 User Account

Table 97: CLI "System Log" Configuration

Node	Command	Description
enable	show user account	This command displays the current user accounts.
configure	add user USER_ACCOUNT PASSWORD (normal admin)	This command adds a new user account.
configure	delete user USER_ACCOUNT	The command deletes an existing user account.

Example

L2SWITCH#*configure terminal*

L2SWITCH(config)#*add user q admin*

L2SWITCH(config)#*add user 1 1 normal*

10.3 Modbus/TCP Tables

10.3.1 Data Format and Function Code

Modbus/TCP supports different types of data formats for reading. The four most important types are:

Table 98: Data Format and Function Code

Data Access Type		Function Code	Function Name	Note
Bit access	Physical Discrete Inputs	2	Read Discrete Inputs	Not supported.
	Internal Bits or Physical Coils	1	Read Coils	Not supported.
Word access (16-bit access)	Physical Input Registers	4	Read Input Registers	
	Physical Output	3	Read Holding Registers	Not supported.

10.4 Modbus Register

The Modbus address space of the Lean Managed Switches starts at 1000 (decimal) for function code 4.

Note

Modbus address space

The Modbus address space is also displayed in Web based management.

Table 99: Modbus Registers

Read Input Registers (Function Code 04) Register Number 30001~39999						
Register Offset		Data Address		Date Length/ Word	For- mat	Description
Dec	Hex	Dec	Hex			
System Information						
1001	3E9	1000	3E8	1	HEX	Vendor ID = 0x30DE
1002	3EA	1001	3E9	16	ASCII	Vendor Name = "WAGO" Word 0 Hi byte = 'W' Word 0 Lo byte = 'A' Word 1 Hi byte = 'G' Word 1 Lo byte = 'O' Word 2 Hi byte = '\0'

1033	409	1032	408	16	ASCII	Product Name = "852-1813_000-001" Word 0 Hi byte = '8' Word 0 Lo byte = '5' Word 1 Hi byte = '2' Word 1 Lo byte = '-' Word 2 Hi byte = '1' Word 2 Lo byte = '8' Word 3 Hi byte = '1' Word 3 Lo byte = '3' Word 4 Hi byte = '-' Word 4 Lo byte = '0' Word 5 Hi byte = '0' Word 5 Lo byte = '0' Word 6 Hi byte = '-' Word 6 Lo byte = '0' Word 7 Hi byte = '0' Word 7 Lo byte = '1' Word 8 Hi byte = '\0' Word 8 Lo byte = '\0'
1065	429	1064	428	7	ASCII	Product Serial Number Ex: Serial No=A0000000000001
1081	439	1080	438	12	ASCII	Firmware Version=" V1.0.1.S0" Word 0 Hi byte = 'V' Word 0 Lo byte = '1' Word 1 Hi byte = '.' Word 1 Lo byte = '0' Word 2 Hi byte = '.' Word 2 Lo byte = '1' Word 3 Hi byte = '.' Word 3 Lo byte = 'S' Word 4 Hi byte = '0' Word 4 Lo byte = '\0' Word 5 Hi byte = '\0' Word 5 Lo byte = '\0' Word 6 Hi byte = '\0' Word 6 Lo byte = '\0' Word 7 Hi byte = '\0' Word 7 Lo byte = '\0' Word 8 Hi byte = '\0' Word 8 Lo byte = '\0'
1097	449	1096	448	16	ASCII	Firmware Release Date="Mon Sep 30 18:51:45 2013"
1113	459	1112	458	3	HEX	ETHERNET MAC Address Ex: MAC = 00-01-02-03-04-05 Word 0 Hi byte = 0 x 00 Word 0 Lo byte = 0 x 01 Word 1 Hi byte = 0 x 02 Word 1 Lo byte = 0 x 03 Word 2 Hi byte = 0 x 04 Word 2 Lo byte = 0 x 05

1129	469	1128	468	1	HEX	Power 1 (PWR) Alarm 0x0000: no alarm 0x0003: No PWR input
1130	46A	1129	469	1	HEX	Power 2(RPS) Alarm 0x0000: no alarm 0x0003: No RPS input
1145	479	1144	478	1	HEX	Fault LED Status 0x0000: No 0x0001: Yes
