DrSense FG1 Series Mechanical Variable Area Flow Meters

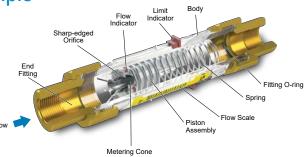

Overview

The ProSense FG1 Series of mechanical variable area flow meters provides visual indication of flow rate for water or petroleum based fluids. Constructed of highimpact polysulfone plastic, these flow meters are available with 1/2", 3/4" or 1" NPT process connections and several easy to read flow scales in both gallons per minute (GPM) and liters per minute (LPM). Their unique spring loaded variable area design allows the FG1 series flow meters to be installed in-line in any position without affecting accuracy and makes them relatively insensitive to shock and vibration. No special plumbing or accessories are required to stabilize turbulent flow because the FG1 series meters can be installed immediately adjacent to 90-degree elbows or other piping components allowing for system design flexibility. These meters provide +/-5% full scale accuracy when monitoring liquids with viscosity and specific gravity similar to the factory calibrated fluids and a repeatability of +/-1% that is important for cyclical applications requiring consistent readings. Two adjustable flow limit pointers are available to provide preset indication of high, low, or normal flow rates.

Variable Area Flow Meter Measuring Principle

The ProSense FG1 Series Flow Meter is a variable area instrument. A precision molded, sharp-edged Orifice, located within the Piston Assembly, forms an annular opening with the Metering Cone. Flow through the meter creates a pressure differential across the sharp-edged orifice, moving the piston against the Spring. The piston moves precisely, in direct proportion to the rate of flow. The calibrated spring opposes flow in the forward direction. This spring decreases viscosity sensitivity and allows the flow meters to be used in any position, including inverted. The indicated flow rate is measured by viewing the red Flow Indicator line on the piston relative to the numerical flow scale, mounted on the outer surface of the transparent flow meter body.

OrSense FG1 Series Mechanical Variable Area Flow Meters

Pressure Drop/Flow Rate

The pressure drop curve is valid for fluids with density and viscosity similar to factory calibration fluids. Fluids with higher viscosity than these test fluids yield a higher pressure drop through the flow meter and piping system per a given flow volume.
