The programmable controller with

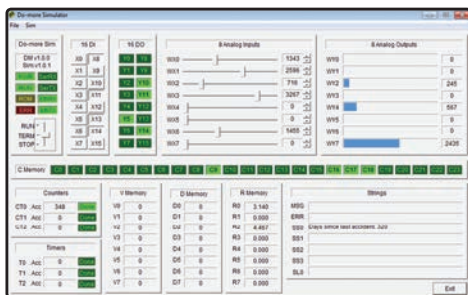

The FREE Do-more Designer software for Do-more H2 series PLCs gives you advanced tools that can cost thousands from others.

Download at www.do-moreplcs.com and check it out.

Built-in simulator

The built-in simulator creates a virtual PLC so you can test your logic without the hardware present. The Windows application runs on your PC and uses the same code as the CPU firmware for the most accurate simulation. Test part of your logic or whole programs quickly and conveniently.

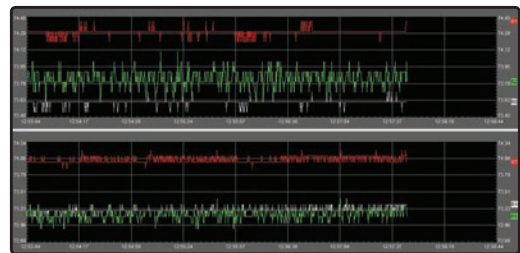

- Simulates discrete and analog I/O with access to timers, counters, control bits, etc.
- Simulate PID - use the Simulator coupled with the Trend View for outstanding visibility into your PID processes

Insightful monitoring, trending and troubleshooting tools

Use these tools for real-time tuning and testing:

- Debug View window can suspend each task and program separately
- PID View window allows precise tuning of your PID loops
- Data View window monitors your chosen program elements - discrete or analog I/O, and system parameters
- View Trend Data in its own view as well as within specific ladder instructions like PID, RAMPSOAK, and High/Low Alarm
